Introduction

Theoretical background

Model development

Model testing

Conclusions

Discussion

## Action research

Participation in the project organisation

# Testing the model

Missing model input resulted in scenario tests

Standardised modes of transport, average distances, variety of load factors, variety of storage periods

# Validation with experts

A survey with statements

Operator of the CCC, and project managers of the contractor

Wonderwoods

Introduction Theoretical background

Model development

Model testing

Conclusions

Discussion

# Findings Model input

Project related data

Material quantities, locations, modes of transport

Experience-based data

Cost related to activities at the CCC

Generic cost data

Labour costs, production speed, equipment costs

# Findings activities

Transport (traveling, waiting & loading)

Handling at the CCC

Storage at the CCC

# Experts Model input

Mention that the project related data becomes available in a later stage of the project

Mention that the model and results provide insight into the costs for the tested activities

Agree that the other activities should be included in the model

Introduction Theoretical background

Model development

Model testing

Conclusions

Discussion

To what extent can the logistical costs related to construction be modelled in the preparation stage of a project to predict the impact of the implementation of a Construction Consolidation Centre?

Logistical costs related to construction

on

Modelling requires input

Transport (travelling, waiting, loading)

Project related data

Costs at the CCC (handling, storage, consolidation)

Experience-based data of the CCC

Cost on-site (unloading, transport, fixing)

Generic cost data

Predicting the impact in the preparation stage

At the start only averages and estimations, results in just insights for scenarios

Supplier selection, planning and detailed information on materials and the site.

will increase the predictability of the impact

Introduction

Theoretical background

Model development

Model testing

Conclusions

Discussion

Research Model

Focussed on Design-bid-built Benchmarking

Potential for design changes Compares traditional with new at a moment in time

Focussed on Business Economics Impact of project organisation

Example: buffer storage, can be short without mistakes

Introduction Theoretical background

Model development

Model testing

Conclusions

Discussion

## Missing activities, cost categories, and experience based data

Procurement, process management, storage at supplier

Costs of capital

Measure the impact of activities included in the model

Innovations for personnel and waste collection

Significant reductions

Different process

Factors for implementation

Data, project team, financial transparency, and time

Monitor the Wonderwoods project

Measure actual transport distances, waiting and loading times etc.

Introduction

Theoretical background

Model development

Model testing

Conclusions

Discussion

#### Communication structures

Structured formats

Saves time

## Transparency

Theoretical cost savings only lead to savings when implemented in contracting stage of a project

#### Invest in data

Measure the performance of projects, will help to prove the benefits

#### Generic cost data

Use the expertise of companies that are specialised in collecting generic cost data
