Graduation Plan

Master of Science Architecture, Urbanism & Building Sciences

Graduation Plan: All tracks

Submit your Graduation Plan to the Board of Examiners (Examencommissie-BK@tudelft.nl), Mentors and Delegate of the Board of Examiners one week before P2 at the latest.

The graduation plan consists of at least the following data/segments:

Personal information	
Name	Maxwell Sterry
Student number	5086809

Studio		
Name / Theme	Public Building / Public Condenser	
Main Mentor	Stefan Witteman	Project Design
Second Mentor	Florian Eckardt	Building Technology
Third Mentor	Stefano Corbo	Research
Argumentation of choice of the studio	The Public Building Studio appealed due jointly to its location in Berlin, a city with a rich historical and cultural background, as well as its focus on the Commons. Public spaces are critical elements of the urban fabric, and the concept of a Public Condenser appealed for its focus on promoting social and cultural exchange. The scale of the project and a strong focus on environmental resilience also served as strong factors behind the decision. The notion of a prototypical building, more specifically a prototypical process of building creation, seemed like a topic that meshed well with prior interests and studies.	

GRADUATION PLAN

Graduation project	
Title of the graduation project	Hacking Architecture – An Ever-Changing Prototype in Friedrichshain
Goal	
Location:	Wriezener Karree, Berlin, Germany.
The posed problem,	The need for adaptable buildings as a response to climate change is known. Repurposing existing structures and building materials are significant means of reducing the environmental impact of space making. This process of users appropriating and adapting the built environment, overwriting past functions and meanings with new ones, is prevalent within the urban fabric of Berlin and has become part of the identity of the city. Two terms which shaped the early explorations were loose fit architecture and hackable buildings. This research proposes a typology between these terms which provides the scaffolding to allow and encourage users to alter the space to suit the changing needs placed upon the building. The primary aim of this typology is to reduce the initial resource input into buildings, increase the longevity and resiliency of the structures, and help form more meaningful relationships between people and spaces they inhabit. Berlin, like many cities, is experiencing the effects of gentrification as property prices continue to rise. The area of Friedrichshain currently boasts the second highest housing expenses in Berlin, despite an average income under the city average. Segments of the population heavily affected by these changes are young families and those in creative fields, many of whom require shop spaces and studios in order to do their craft. In many urban areas the trend of coworking spaces, collaborative workshops, and makerspaces can be observed in response to this. These spaces leverage the increased density and shared resources to make creative spaces more accessible. Such a function would allow residents who may otherwise have been forced to move to other parts of the city to stay in their neighborhood and social networks. The prototype that is the subject of this graduation project would also provide a platform for the exploration of hackability and self-building as tools for developing more local and self-reliant communities.

Research questions and	The primary research topic focuses on the development of a prototypical approach to public buildings that is flexible and adaptive to the changing needs and desires of its users, and the development of systems that allow and encourage this change. What does it mean for a building to be hackable? What differentiates it from other open building or loose fit typologies? What types of systems or layers are changeable by the users of a space? Do systems extend to allowing for the alteration of structural and envelope components of the building, or is user control limited to the infill of a fixed shell? In what ways are these systems global and reproducible in a variety of contexts, and in what ways are they local to the culture, people, and construction methods of their context? To what extent are these buildings exportable and reproducible in different contexts? Do these building systems and logics have the capability to increase the adaptability of existing buildings? What opportunities are afforded for repurposing typologies which may otherwise be undesirable? What does this approach of user driven design mean in terms of authorship of the resulting environment? Or in terms of ownership of the building?
design assignment in which these result.	The course abstract for the studio outlines the notion of a public condenser which leverages multiplicity and hybridity to create more resilient and sustainable buildings. This necessitates a variety of programmatic functions which synergize with each other. Berlin prides itself in its status as a city of culture creation and technological innovation, and like many cities vows a strong emphasis on sustainability and healthy living. The building program and function builds on these aspects and combines it with the local particularities of the district and its constituent neighborhoods. As a prototype, not only for Berlin but also a global context, such a building system would need to be flexible enough to accommodate local building materials, vernacular, construction techniques, and building regulations. The prototype should also serve as a base from

which it can be expanded, replicated, and reinterpreted. The building itself serves as scaffolding for user interventions.

The core program of the building is made up of a few key functions. The hackerspace and makerspace are integral to the ability for users to make physical transformations, integrating and giving better facilities to already existing groups on the site. The artist studios are a response to the increasing lack of affordable artist rental spaces driven by inflation, making use of shared workshop spaces as a means of reducing individual cost. These synergize with the workshop spaces provided by the makerspace. The urban lounge and food hall come as a result of a lack of spaces for members of the community to gather in their neighborhoods and provide opportunities for interactions between the various communities housed within the building. Also benefiting from these adjacencies is the innovation incubator, a direct response to the cities desire to foster innovation in the fields of technology and sustainability. Other more fluid program types, such as coworking areas, performance halls, and education spaces are housed in the flexible spaces that make up the remainder of the program.

Process

Method description

Site Analysis:
An initial group analysis of the site was conducted prior to the physical site visit in order to gain an understanding of the Friedrichshain area through the lens of politics, history, culture, demographics, and the built environment. The one-week site visit that followed was split between touring the city in order to gain a greater understanding of the city, and spending time on the site conducting interviews and identifying potential sites for the interventions.

Upon returning from the site visit a comparison was conducted between the sites that had been identified during the visit. Key criteria included accessibility for both pedestrians and commuters, available building area, urban fabric, and environmental factors. The plot of Wriezener Karree appealed due to its central location between the three Kiezs and easy access via public transportation due to its proximity to Ostbanhof. The building plot was suitable for the scale of the building which targets four thousand square meters, and the light industrial character of the area appealed for the selected programs.

Program Development:
The initial program development was driven by two primary factors. Firstly, research was done to determine what the city of Berlin has defined as priorities for the creation of the built environment. Their roadmap for the next decade in terms of urban development served as a reference point, and in the situation where this project was non theoretical this alignment would prove helpful in gaining funding for the construction and operation of the project. The second driver was a series of interviews conducted with the people who lived within the area, from which a series of personas were developed as tools to refer to throughout the design process.

A number of exercises and explorations were done in the arrangement of this program, including several tests attempting to arrange adjacencies between programs and the site through use of data driven models.

Theoretical Research:
Research began by looking at resources related to open buildings, loose fit architecture, and hackable buildings with the aim of developing an understanding of the research that already exists.

As part of the Theory and Delineation course that is part of the graduation studio, several exercises were undertaken combining various methods of representation and work to help identify and express intentions. Exemplifying the model of research by design, the successive nature of the assignments allowed for the reinterpretation and critical thought of earlier ideas as later explorations were conducted. Several of these methods appear elsewhere throughout the work.

Design Explorations:
The identification and development of building systems capable of supporting the range of freedom the term ‘hackability’ requires is an ongoing process. A key element to this is the distinction between modularity and standardization. Systems like French Cleats serve as a useful reference point for the frameworks that will be developed.

Affordances such as overbuilding and demountability will be explored for their potential for expansion, relocation, and self-replication.

Further research into emerging fabrication techniques and responsive materials will be conducted in search of an alternative to a modular or kit-of-parts style system. These systems often lack the freedom and flexibility for self-expression, spontaneity, and the integration of local vernacular and craft that has been identified as a key criteria for these systems.

Reflection

1. What is the relation between your graduation (project) topic, the studio topic (if applicable), your master track (A,U,BT,LA,MBE), and your master programme (MSc AUBS)?

This graduation project can be seen as a culmination of academic work undertaken at TU Delft, but also includes elements of previous studies at McGill University and TU Wien. Notable components and methods carried over from this previous education include interest in generative design systems, entropy driven design, material science, and self-building.

The notable elements of the master's degree at TU Delft leading up to the graduation studio consisted of four key courses. The form studies studio undertaken in MSc1 focused on the use of physical models as a design tool, with emphasis on the aesthetics, materiality, and sustainability of museum building in Delft. This studio served as an introduction to model making as a design tool as well as a novel approach to the design process.

Following this, MSc2 included a façade design course centered around the reuse and repurposing of modular facade elements recovered from the partial demolition of a bank building in Amsterdam. Conducted in conjunction with students from the tracks of Building Technology and Civil Engineering, the course introduced some of the more technical aspects of reuse and performance design. The Theory Thesis course, also undertaken within the third quarter, focused on the topic of self-building as a response to both climate change and the various forms of housing shortages seen throughout the world. This work can be seen as a genesis point for the self-building and hackable building topics being explored in the context of the graduation studio.

The second half of MSc2 featured the Interactive Architecture Studio, which explored the effects of interactive design, artificial intelligence, robotics, and material science as possible routes to create a more efficient and enjoyable built environment. The design project was to design furniture and interior landscape for the TU Delft Library building implementing these technologies in the design, fabrication, and use phases.

Ultimately, the topic of the graduation studio builds upon topics and interests that have been developed through the preceding academic experience at TU Delft and the prior education and seeks to expand upon these topics to explore something that has the potential to continue to be explored as academia turns to practice.

GRADUATION PLAN

2. What is the relevance of your graduation work in the larger social, professional and scientific framework.

The concept of adaptable and flexible buildings, or "hackable buildings" is becoming increasingly relevant within the larger architecture, social, professional, and scientific frameworks. There are a few key reasons for this:

1. Climate change: Adaptable buildings are a way to reduce the environmental impact of construction and repurpose existing structures, which can be more sustainable and energy efficient.
2. Demographic shifts: As cities and neighborhoods change, the needs and desires of their residents also change. Adaptable buildings can better respond to these shifts by allowing for flexibility and adaptability in their use.
3. Emerging technologies: The development of new materials, fabrication techniques, and building systems is enabling architects and designers to create buildings that are more adaptable and responsive to their users.
4. Community engagement: Hackable buildings that allow for user intervention and participation can create a sense of ownership and belonging for residents, fostering a sense of community and social cohesion.

Overall, the development of adaptable and flexible buildings has the potential to address a range of issues and challenges faced by modern cities and communities, and as such is of significant interest within the larger architecture and design fields.

Time Planning

P1 | Pre-Design | 05.09.2022 - 10.11.2022

Weeks 1.1 to 1.3 focused on the development of initial positions for the project as well as a collaborative analysis of the site and context at the scale of city, district, and neighbourhoods.
Week 1.4 was devoted to a weeklong site visit in Berlin, with three days dedicated to exploring the immediate context, conducting interviews, and developing the initial position.
Weeks 1.5 to 1.9 focused on refining the positions and research questions by way of exploring a variety of working methods and representational techniques. This period also included site selection based on project criteria and the development of a high-level program.
Week 1.10 featured the P1 pre-design presentation and the compilation of a research-by-design journal.

P2 | Concept Design | 17.11.2022 - 30.01.2023

Weeks 2.1 to 2.8 centered on the development of a conceptual design showing the architectural potential and ambitions of the project. The resulting concept should be clearly derived from the research-by-design model which serves as the basis for the design studio.
Between weeks 2.6 and 2.9 students will develop the Graduation Plan outlining future design objectives for P4.

P3 | Preliminary Design | 16.02.2023 - 30.03.2023

The early weeks of P3 will serve as a period of critical reflection on the feedback of the P2 presentations and the work preceding them. This period will be used to clarify the goals of the project and set medium term design goals.
Aspects of the building will be developed at a variety of scales, with the intent of solving much of the design at scales ranging from 1:500 to 1:50. Preliminary details at smaller scales will likely be developed in parallel. Physical models of various scales will be used in conjunction with digital models and computational analysis to explore and test design decisions and interventions. Material design will be explored with an emphasis on emergent materials and fabrication techniques.
The final weeks of this period will be dedicated to the production of deliverables suitable for the preliminary design stages, including but not limited to site plans, floor plans, elevations, and sections of appropriate detail, as well as other supporting documents and models showing the research-by-design process.

P4 | Final Design Part A |06.04.2023 - 30.05.2023

Building materialization and construction will be examined at scales ranging from 1:20 to 1:1 as appropriate in both technical drawings and physical models and prototypes. Hackability and adaptability will be tested by exploring how the space can be altered to accommodate different program types. Visualizations of the building and context will be developed by combination of physical and digital models, and a high detail working model will be produced.

P5 | Final Design Part B | 08.06.2023 - 30.06.2023

Final corrections of materials, production of completed research-by-design journal, and finalizations of physical models at appropriate scale and level of detail.

REFLECTION TEXT

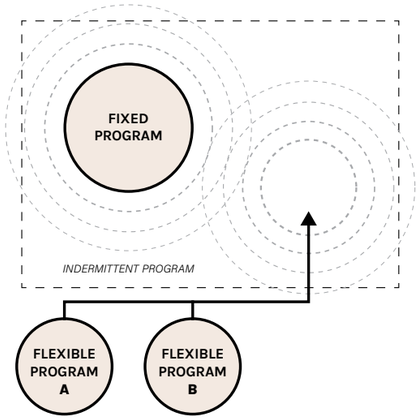
INTRODUCTION

The public building graduation studio focused on the the central theme of the commons, with the design brief of the public condenser. This core notion, along with the four pillars of hybridity, multiplicity, resilience, and sustainability, formed the initial principles against which research and design were referenced.

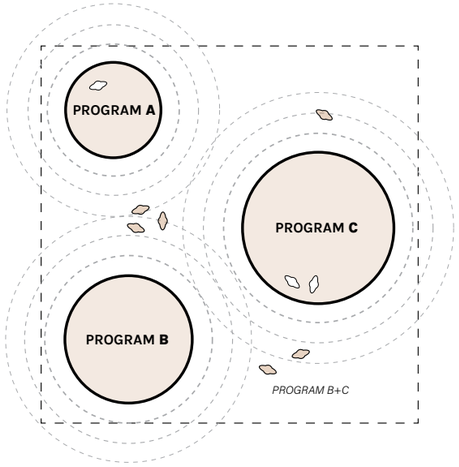
Friedrichshain, the neighborhood in Berlin designated as the site for the studio project, is still visibly affected by the aftermath of reunification following the fall of the Berlin Wall. During the site visit, what stood out to me was a city that is constantly redefining and overwriting itself.

The process of redefining and reinterpreting the built environment is exemplified by Berghain, one of the notable landmarks in the neighborhood. The former power plant has been transformed into a nightclub of international reputation.

The concept of hackable architecture was originally intended as an exploration of what an architecture that encourages transformation and redefinition would look like. This type of architecture gives users the freedom to shape the space and make it their own, with the end result being a reflection of the users themselves and the community they belong to, with the aim of fostering a sense of collaboration and inclusivity. It is also a way to challenge the traditional notion of a static and unchanging built environment, instead embracing the idea that spaces can be dynamic and adaptable to the people who use them.



LOOSE FIT AND MULTIPLICITY

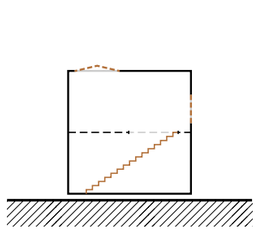


FIXED VS. SPONTANEOUS SPACE

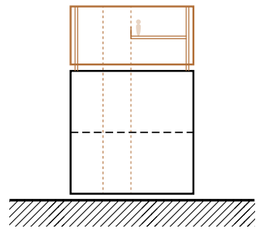
RESEARCH METHODOLOGY

Early stages of research focused on developing concepts that would allow for greater flexibility in architecture. One such concept was ‘loose fit’, which involved designing spaces to be overbuilt so that in the future they could accommodate a wider range of functions. Another important topic was the ‘sites and services’ model proposed by John Turner for social housing, which was examined and its principles translated to match the proposed program of makerspace, artist studios, and commoning areas.

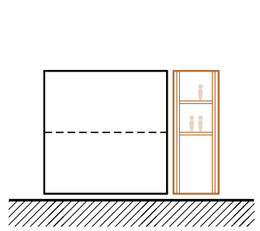
These ideas were explored through concurrent application to new buildings on the site as well as the transformation and augmentation of the existing building stock found on the site. The juxtaposition of the two spaces was particularly important as it allowed for a clear illustration of the differences between high and low adaptability spaces. Working with the rather limiting system of the Plattenbau allowed for the development of a prototypical toolkit of interventions, akin to the process of hacking sought after in the project at a user scale. This cyclical approach between design and research was a critical component of the development of the project, and one that was invaluable to my own learning throughout the process.



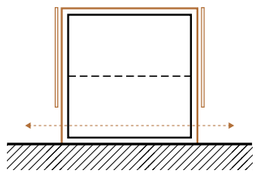
ALTERATION



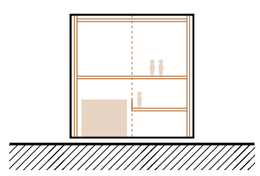
EXTENSION



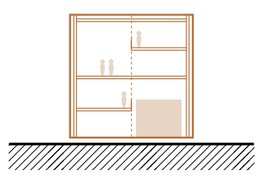
AUGMENTATION



ENVELOPING



INFILLING



BUILDING

One weakness in the methodology used is that the act of hacking, one of the foundational concepts of the proposal, is inherently something that is difficult to incorporate. It requires both the hacker and the hacked, the former of which is an unknown user at an unknown future point, and the latter, the object that results at the end of the design process. While the use of the personas used to characterize the neighborhood are an effective narrative device, I feel there were better methods that could have been used to simulate the act of hacking throughout the design process.

REFLECTION TEXT

1. What is the relation between your graduation project topic, your master track (Ar, Ur, BT, LA, MBE), and your master programme (MSc AUBS)?

This graduation project can be seen as a culmination of academic work undertaken at TU Delft, but also includes elements of previous studies at McGill University and TU Wien. Notable components carried over from this previous education include interest in generative design systems, material science, and self-building.

The master's degree at TU Delft leading up to the graduation studio consisted of four key courses. The form studies studio undertaken in MSc1 focused on the use of physical models as a design tool, with emphasis on the aesthetics, materiality, and sustainability of a museum building in Delft. MSc2 included a façade design course conducted in conjunction with students from the tracks of Building Technology and Civil Engineering which centered around the reuse and repurposing of modular facade elements recovered from the partial demolition of a bank building in Amsterdam. The Theory Thesis course, also taken within the third quarter, focused on the topic of self-building as a response to both climate change and the various forms of housing shortages seen throughout the world. This work can be seen as a genesis point for the self-building and hackable building topics being explored in the context of the graduation studio.

The second half of MSc2 featured the Interactive Architecture Studio, which explored the effects of interactive design, artificial intelligence, robotics, and material science as possible routes to create a more efficient and enjoyable built environment. The design project was to design furniture and an interior landscape for the TU Delft Library building, implementing these technologies in the design, fabrication, and use phases.

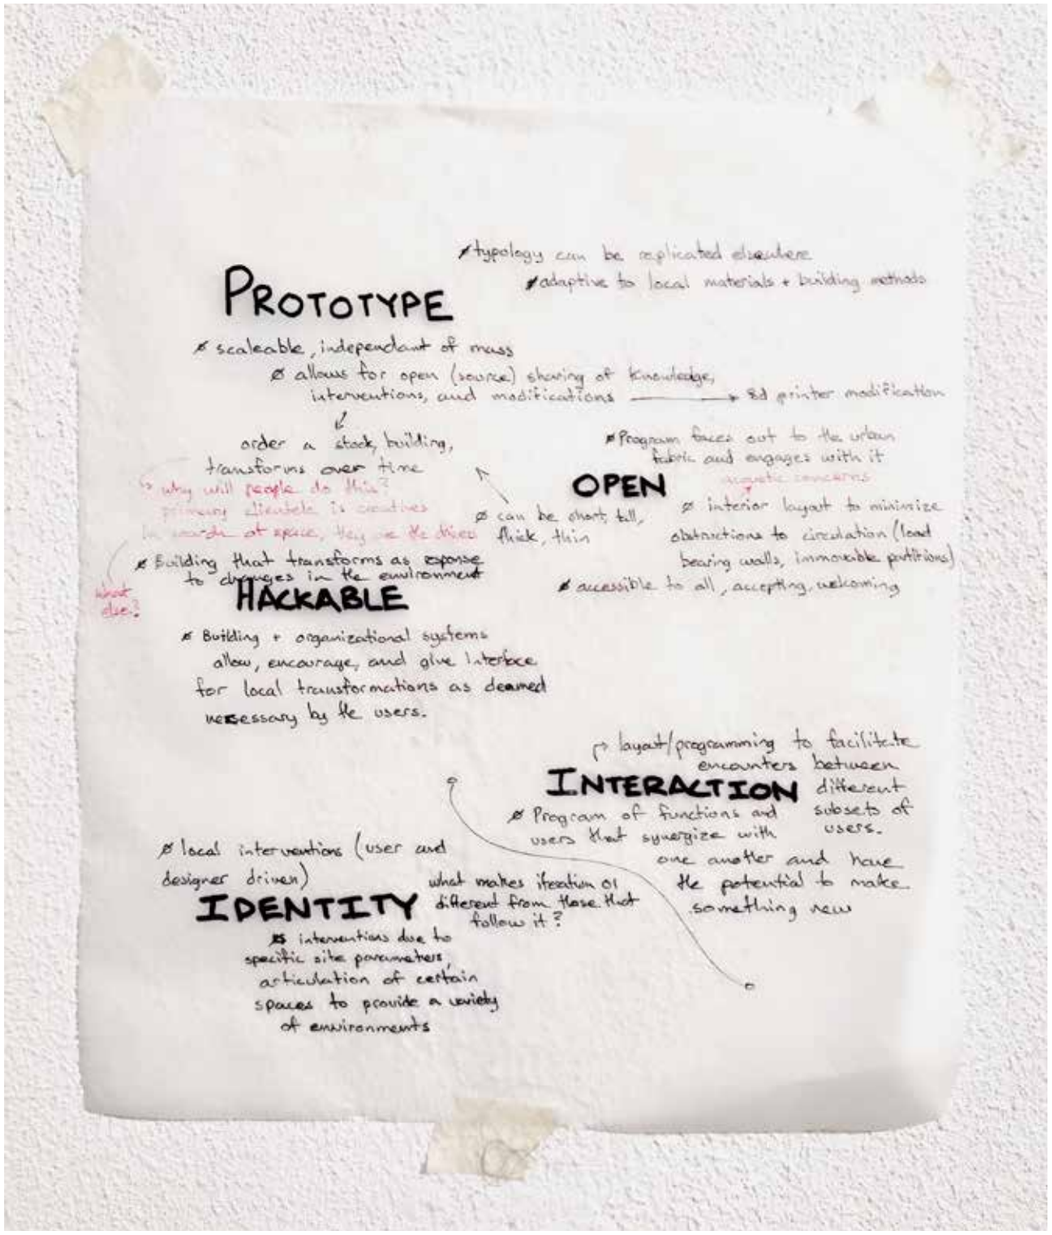
Ultimately, the topic of the graduation studio builds upon topics and interests that have been developed through the preceding academic experience at TU Delft and prior education and seeks to expand upon these topics to explore something that has the potential to continue to be explored as academia turns to practice.

2. How did your research influence your design/recommendations and how did the design/ recommendations influence your research?

The research on adaptable and hackable buildings, loose-fit architecture, and user-driven design such as co housing were strongly influential in developing a framework for the project. The notion of a public condenser that leverages multiplicity and hybridity to create more resilient and sustainable buildings was developed based on research surrounding the need for adaptable buildings as a response to climate change. There are several points in which the design informed new research. One case of this was a deep exploration into the topic of thermal mass, thermal alliesthesia, and natural ventilation to support a primarily passive climate strategy.

The design of the public condenser prototype aims to reduce the initial resource input into buildings, increase the longevity and resiliency of the structures, and help form more meaningful relationships between people and the spaces they inhabit. The building is intended to serve as a base, from which it can be expanded, replicated, and reinterpreted.

The recommendations for the core program of the building were informed by the research on the lack of affordable artist rental spaces, the need for spaces for members of the community to gather in their neighborhoods, and the trend of coworking spaces and makerspaces in response to gentrification. The transient program types were included to allow for more fluid and adaptable use of the space by users, responding to the idea of user-driven design and the appropriation of space by the urban fabric of Berlin.



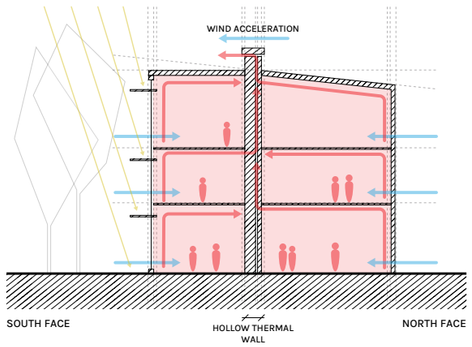
EARLY CONCEPTUAL MAPPING WORK

In turn, the design recommendations influenced further research into the concept of loose-fit architecture and hackable buildings as tools for developing more local and self-reliant communities. The research explored the potential of makerspaces and collaborative workspaces in creating more localized economies and networks of goods while encouraging the exchange of knowledge and skills. The concept of a circular economy, using quantities of material often unsuited to larger architectural interventions, was also explored, further expanding on the idea of reducing the initial resource input into buildings.

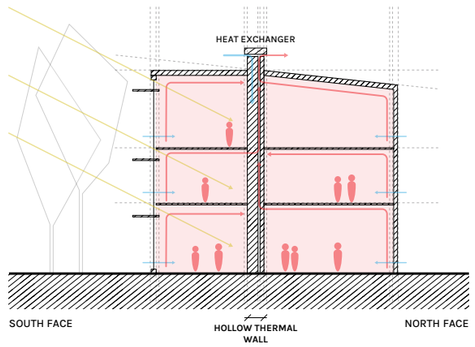
3. How do you assess the value of your way of working (your approach, your used methods, used methodology)?

The methodology used throughout this graduation project is similar in many ways to that taught in previous academic experiences, with research and design both being treated as important elements within the design process.
The initial site studies and excursion formed a base understanding and identified some urban conditions within which research questions and program emerged. While the choice of program was, in part, driven by my own interests preceding the graduation studio, there existed a strong argument supporting the choice of program based on the various data points collected within the this research phase. Some of these data points are: societal and economic trends in the areas, the urban roadmap published by the municipality, and interviews with residents of the neighborhood.

As mentioned previously, one difficulty found in the methodology was incorporating the act of hacking, as it is reliant on having a set object which can be hacked. The personas used to characterize the neighborhood were an effective narrative device, but ultimately were difficult to incorporate before the later stages of the project.



CLIMATE SCHEME - SUMMER
HEAT REJECTION, NATURAL VENTILATION, MICROCLIMATES



CLIMATE SCHEME - WINTER
SOLAR HEAT GAIN, RETENTION, AND HEAT RECOVERY

One weakness I have identified with my process more generally is a tendency to fixate on solving particular low level issues before a design process calls for it. One notable example within the graduation studio was a period of several weeks during P3 where my energy was focused almost entirely on developing a climate scheme utilizing a thermal wall at the expense of exploring higher level design decisions such as massing and façade studies. I feel there is great benefit to shifting between a larger urban or architectural scale and more detailed design, opening opportunities for one scale to inform the other, but it is something that I feel a need to better regulate.

4. How do you assess the academic and societal value, scope and implication of your graduation project, including ethical aspects?

The concept of adaptable and flexible buildings is becoming increasingly relevant within planning and architectural frameworks. Hackable buildings push this concept, proposing a typology that encourages users to alter space as a means to increase the resiliency of the built environment. It proposes architecture not as a product, but as a framework within which members of a community operate and live.

Adaptable buildings are a way to reduce the environmental impact of construction and repurpose existing structures, which can be more sustainable and energy efficient. Finding ways to repurpose existing building stock and materials and encouraging this act within the building represents a cultural shift from current day methods and ideologies. The use of low impact natural materials in the construction process, integration of different climate zones, and potentially demountable construction components all support a design reacting to environmental realities, which for me is one of the chief ethical concerns of any designer in the current day.

As cities and neighborhoods change, the needs and desires of their residents also change. Adaptable buildings can better respond to these shifts by allowing for flexibility and adaptability in their use. This is becoming a larger issue as people continue to become increasingly nomadic. Hackable buildings that allow for user intervention and participation can create a sense of ownership and belonging for residents, fostering a sense of community and social cohesion.

The development of new materials, fabrication techniques, and building systems is enabling architects and designers to create buildings that are more adaptable and responsive to their users. These same tools also give regular users the freedom to make, learn, and interact with their environments in a variety of ways.

5. How do you assess the value of the transferability of your project results?

The notion of developing a prototypical building has been a consistent theme throughout the design process. In many ways I feel that this component of the project has been a success.

One area where this is present is the study and proposed transformation of the Plattenbau building. This style of building is present throughout Eastern Europe, and variations of plate concrete buildings can be found in many other parts of the world. Many of these have limited potential to be transformed or altered within the scope of the users of the space. The methods employed for the transformation of this particular Plattenbau building can be applied to any number of similar constructions with similar results.

One area of the project that I intend to develop further for during the P5 period looks specifically at this prototypability, exploring the implementation of these ideas on other existing buildings in the near proximity, proposing a high level scheme of what the project might look like had those sites been selected in place of the current one.

THEORY AND DELINEATION

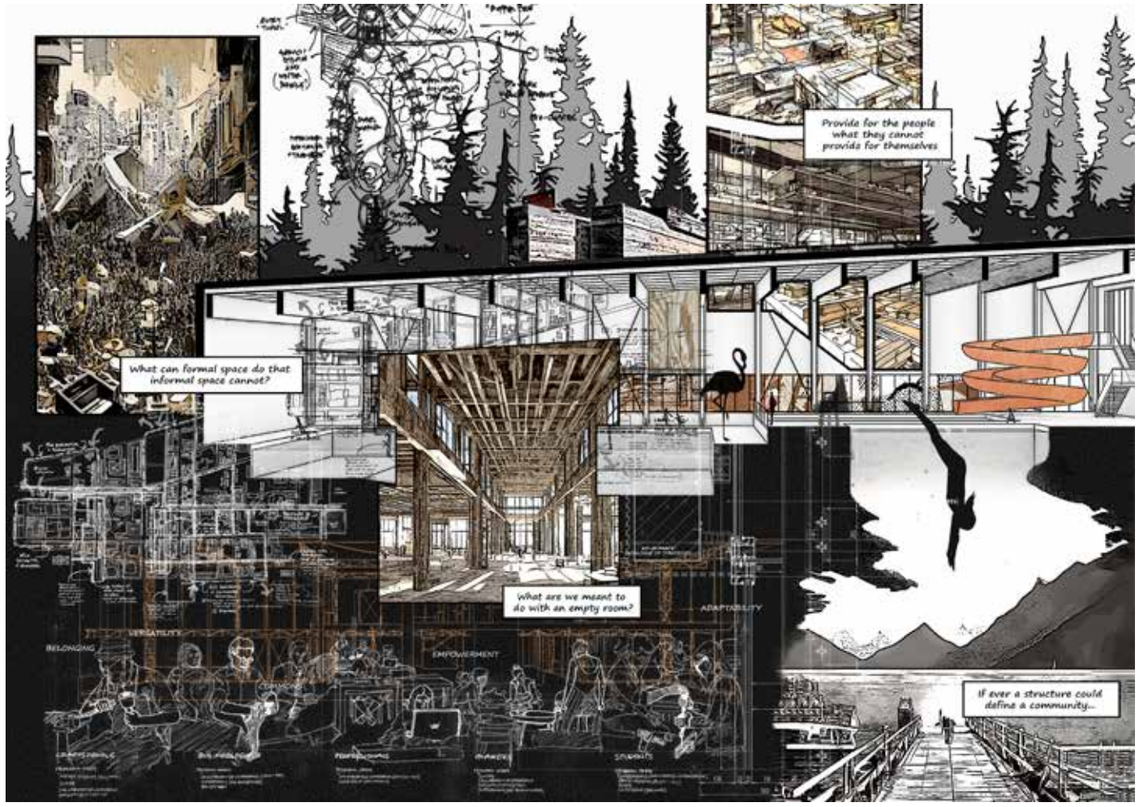
WEEKLY ASSIGNMENTS

COLLAGE AND MONTAGE

ORIGINAL COLLAGE

In the initial attempt at making a collage that was representative of my early thoughts on the topic of public building I relied heavily on my lived experiences. The rural part of Canada where I grew up didn't have public building. We did however have public spaces, the community beach (lower right) and the mountain lookout (forested background) were spaces where the community regularly gathered. Growing up the willingness to actively change these environments, building benches, rope swings, firepits, were normal. There was an element of lawlessness to the authority of the user.

In contrast to this, much of academic and professional experience treated architecture as static and unmoving, with few accordances for any actions not specified in the design brief. As a designer, creating opportunities for the unexpected limits ones control, which I attempted to represent through the use of AI generated images.



ORIGINAL COLLAGE EXERCISE

REVISITED COLLAGE

What I feel I missed in the original exercise was the question of what a public building should be in the city of Berlin, and more specifically the are of Friedrichshain. Revisiting the collage after the excursion allowed me to bring some of my experiences into the collage.

Changing the backdrop from one of mostly nature to one of mostly city better reflects the ratio of built environment to green space in Berlin. The use of graffiti and murals an representation of both the history of street art in Berlin but also the willingness and history of appropriating abandoned buildings and spaces. The elements of code throughout serve as a visual link to the importance Berlin places on technology and innovation.

Again AI image generation was used as a means of representing the ambiguity between design and use, with a loose logic of coloured elements representing the life of the city against a dark background.

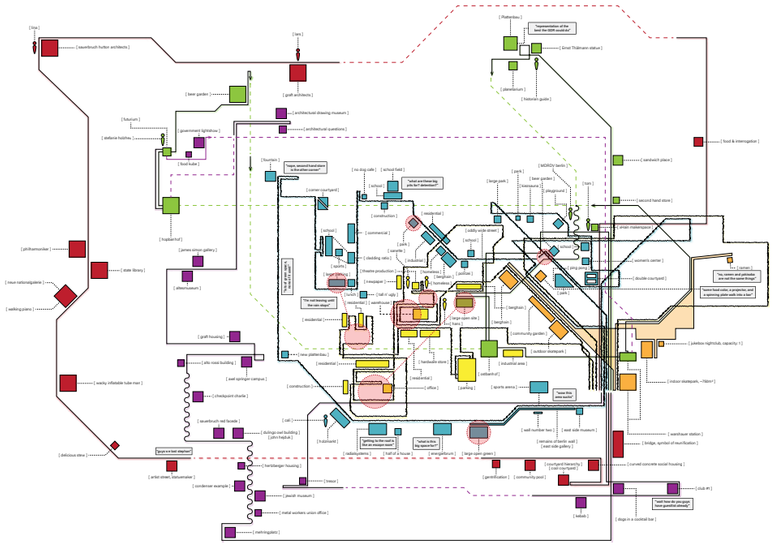
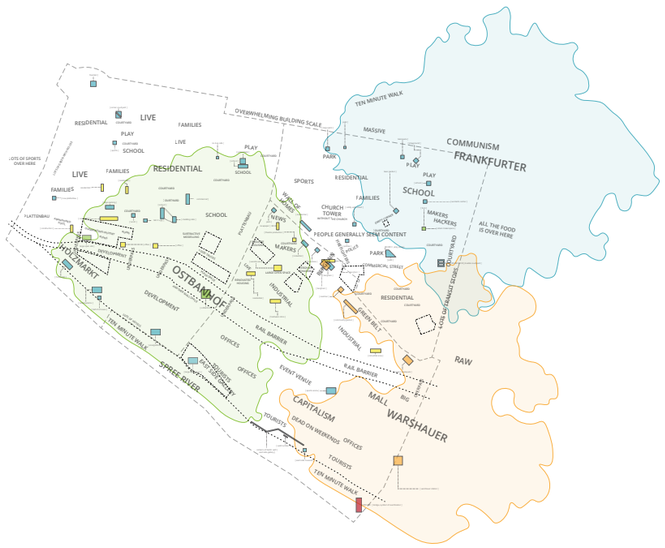
MAPPING

ORIGINAL COLLAGE EXERCISE



ORIGINAL COLLAGE EXERCISE



REVISITED COLLAGE EXERCISE

EXPERIENCING AND RECORDING

Throughout the trip my method of recording my surroundings on site was primarily through photos and sketch. These egocentric sketches of my surroundings and the relationships I saw built up my understanding on the area. The early sketches bear little resemblance to the cartographic version of the area, but the later sketches are relatively accurate and recognizable.

OVERWRITING AND SUPERIMPOSING

Translating the innacuraccy of the sketched fragments into a cohesive whole was done by superimposing the travel path of each day over top of one another. The ‘metro’ style logic developed as a way to keep individual elements somewhat legible while further abstracting the journey. Due to the way the information was recorded and map created, there are often multiple instances of the same building. Berghain appearing three times and the MDRDV site appearing twice are examples of this. Other elements, such as memorable quotes or people that I met, also appear on this map.

INTERPRETING AND ANALYZING

While the previous map did a fine job of representing my experiences on thje excursion, there was little analysis done with that data. A second map was produced which placed all the elements (or ‘metro stations’) from the previous map into their geographically correct positions. Language was used to try and describe the findings and character of various areas. Possible sites for the design studio were highlighted on the map for further investigation. Ten minute walking paths from each of the nearby transit stations were added to help give a sense of scale to the map.

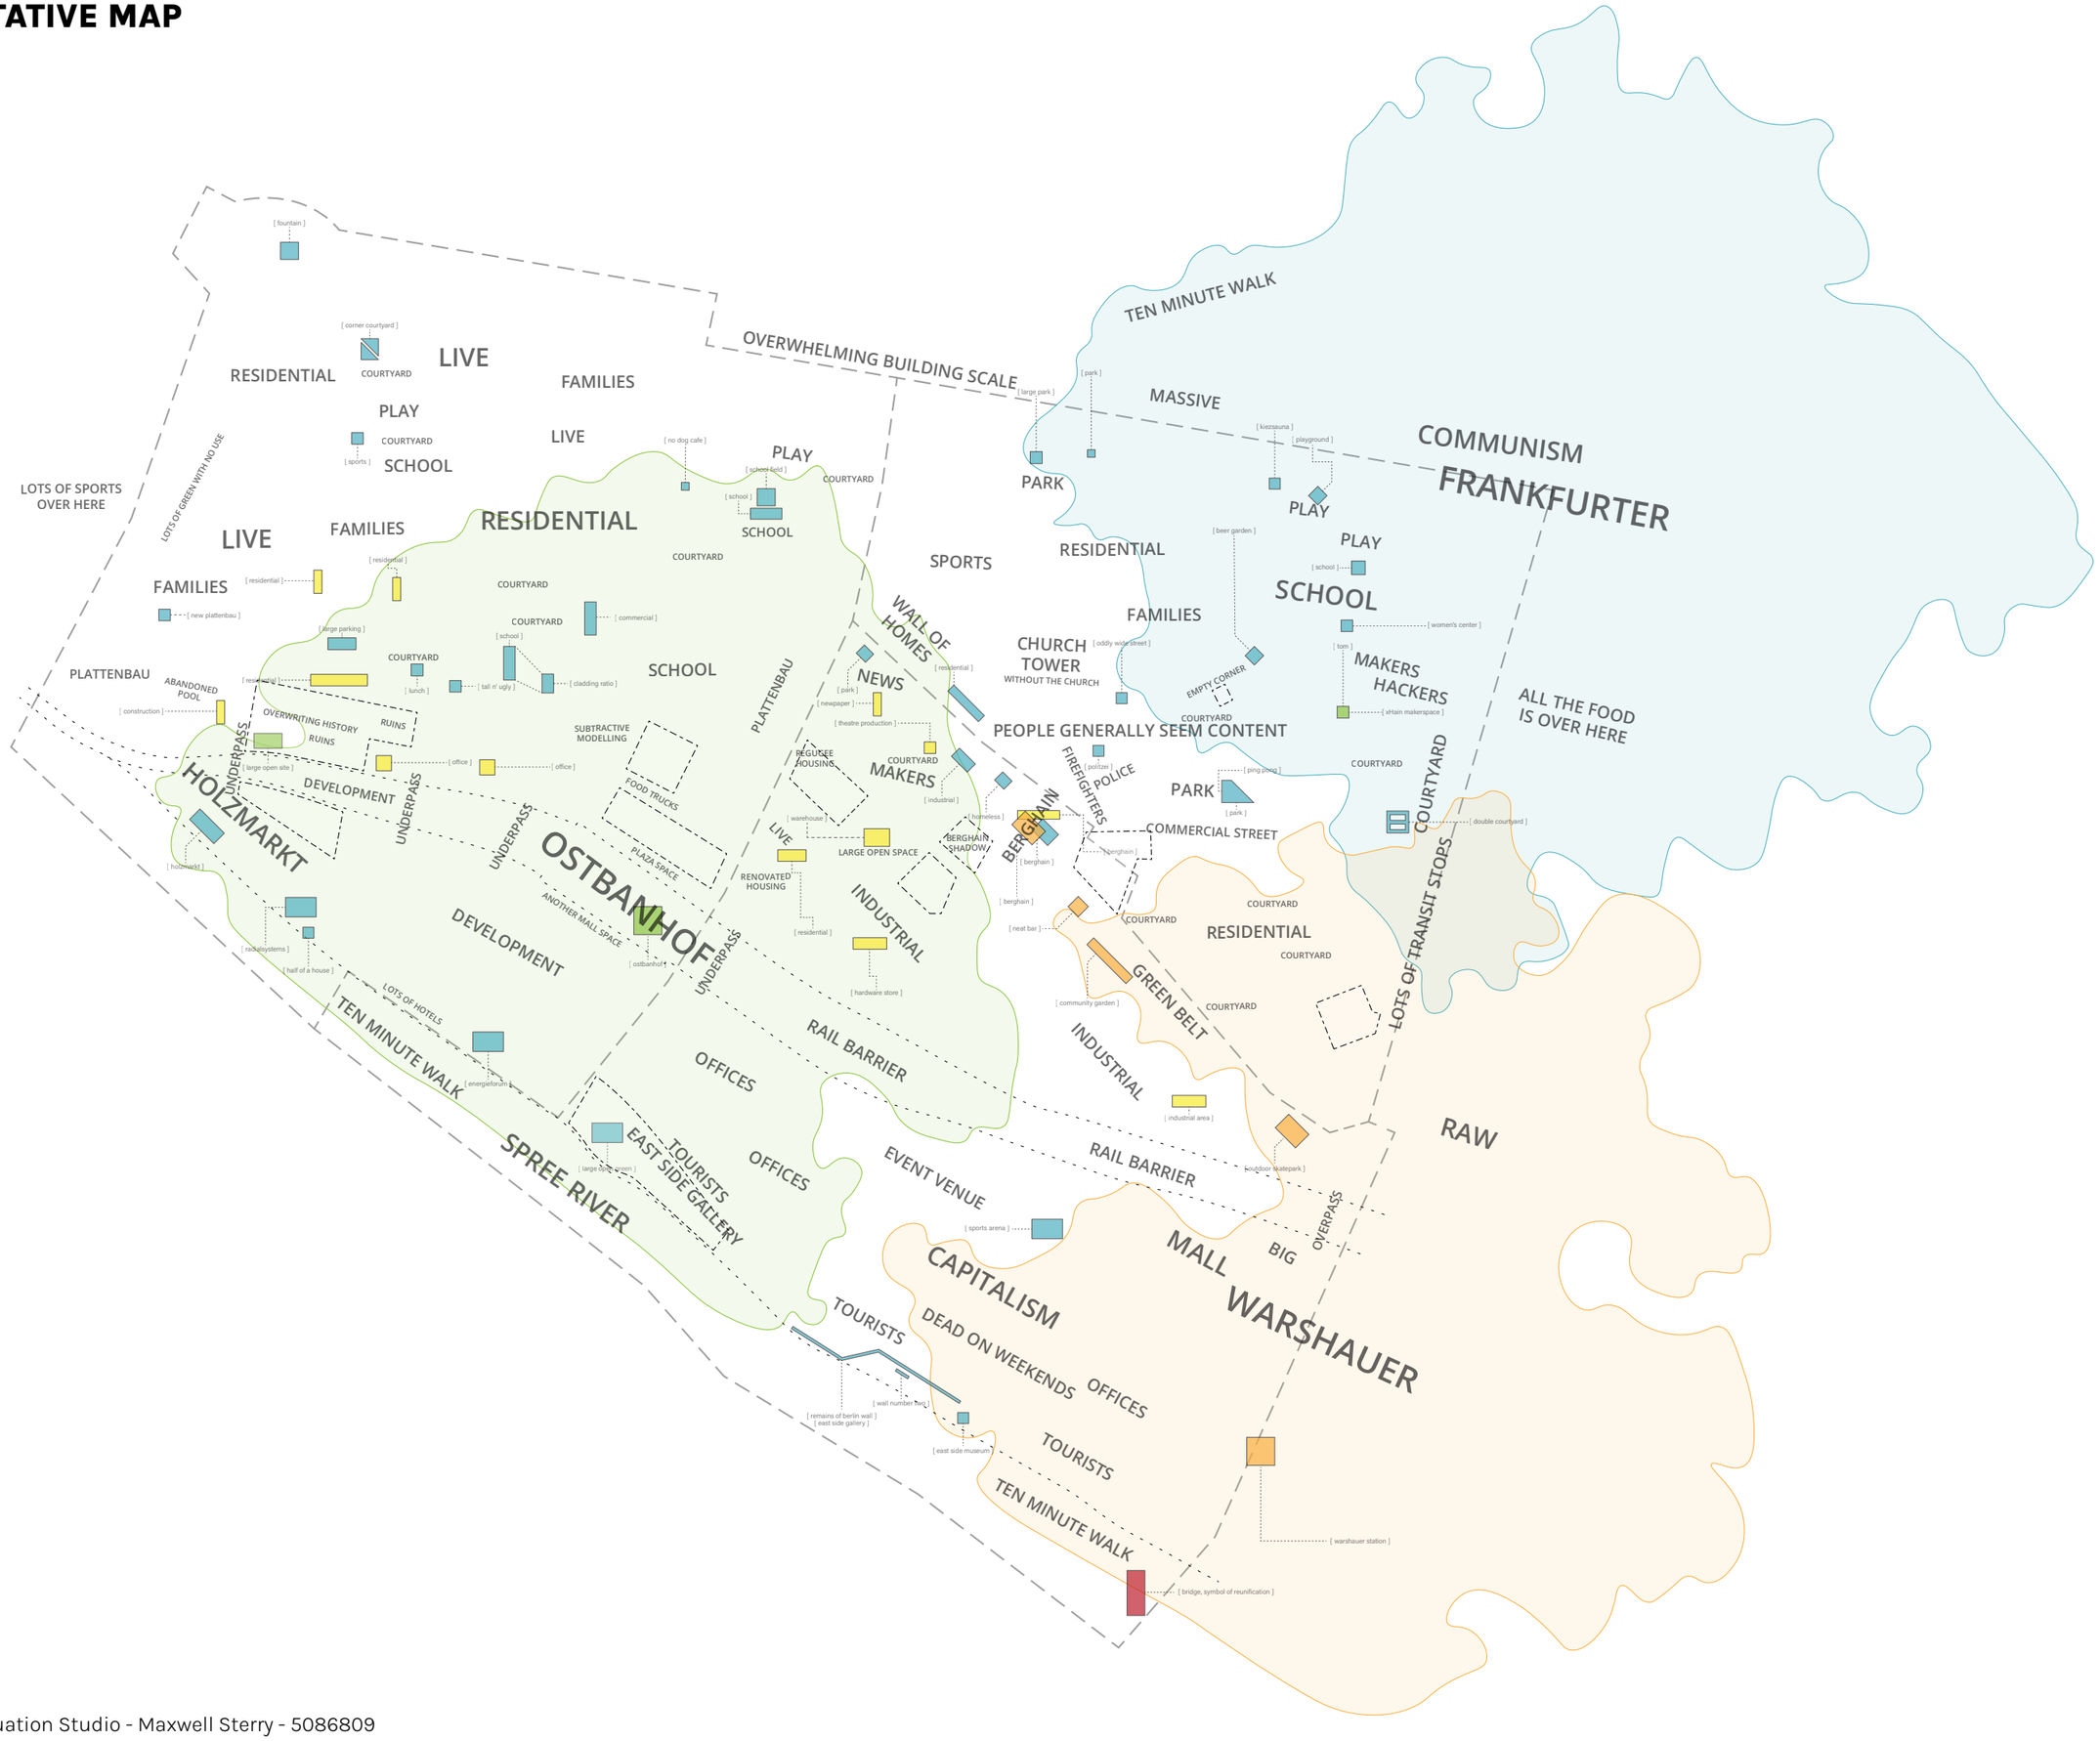
INTERPRETATIVE MAP



ASSEMBLAGE MODEL

PHYSICAL MODEL

The physical model was an exploration of process and craft. There was no defined plan, each element was its own intervention that built upon the existing framework and provided the context for the next element. The elements themselves came from a collection components from past models, reclaimed furniture, and the mystery household hardware box.

Many of these elements carry with them traces of their past uses. A possible future intervention would be to dissemble the model and rebuild it into a different assemblage, leaving behind even more traces of its current permutation. This type of history is clearly seen around Berlin, from firewalls indicating the presence of neighboring buildings at one time to old windows being bricked up with different sized bricks to the rest of the building,

The third element that I felt was important to express in this model was the presence of the tools used to produce it. Having the required tools to change the model and modify it to suit present needs is a key element of my proposal.

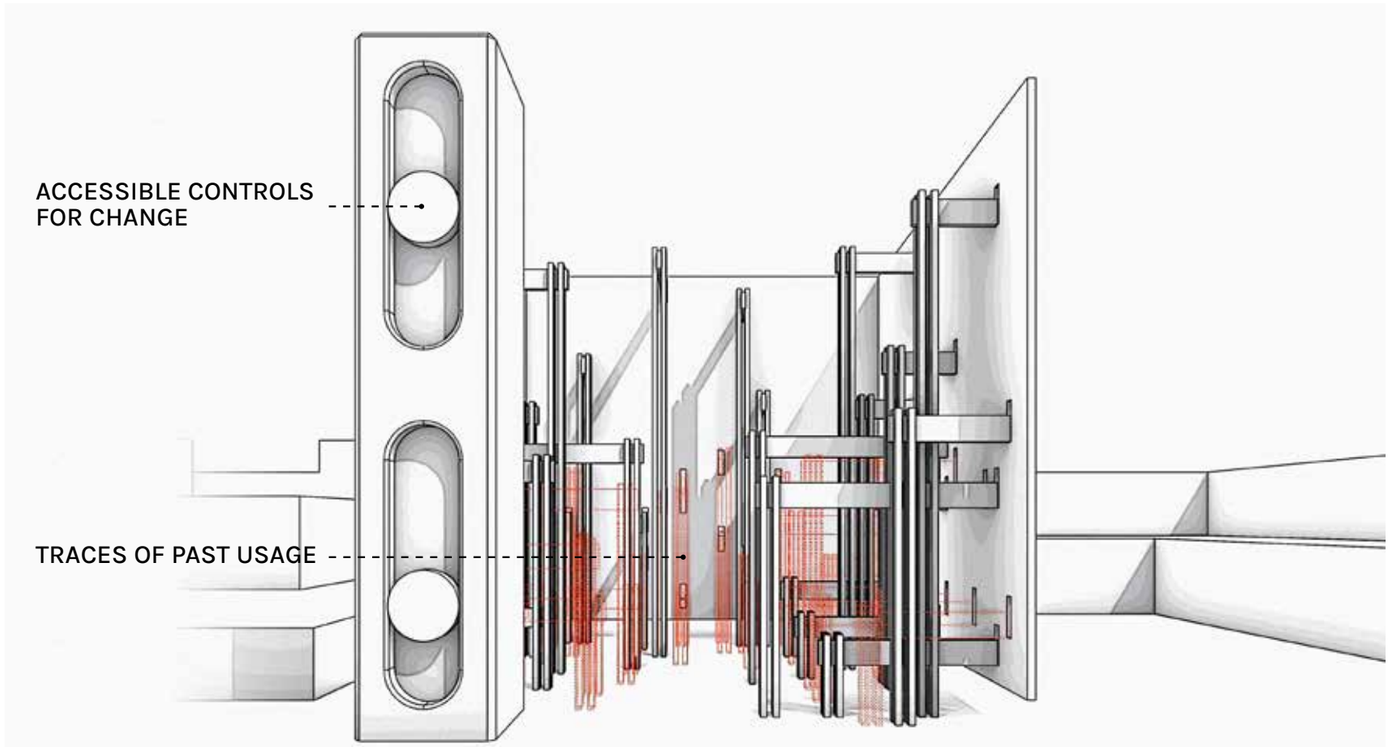
DIGITAL MODEL



DIGITAL MODEL

Interpreting the physical model in a digital form proved challenging, as many of the inputs for the physical model did not have a ready digital equivalent. Instead, I chose to focus on the aspects of scalability, reconfigurability, and the traces left by the changes in the buildings operation.

Key elements of the script created for the generation of the digital model are the “physical” controls, with interfaceable elements serving as the tools used to generate different varatiations, and with each variation keeping a record of past permutations.

As with most parametric based models, the complexity number of possible permutations grows with the number of inputs and outputs. The need for rigorous rulesets and definitions limits the possibility for uniqueness, freedom, and personality found in the physical model. This juxtaposition mirrors the theoretical difference between altering a modular system and hacking an existing system.

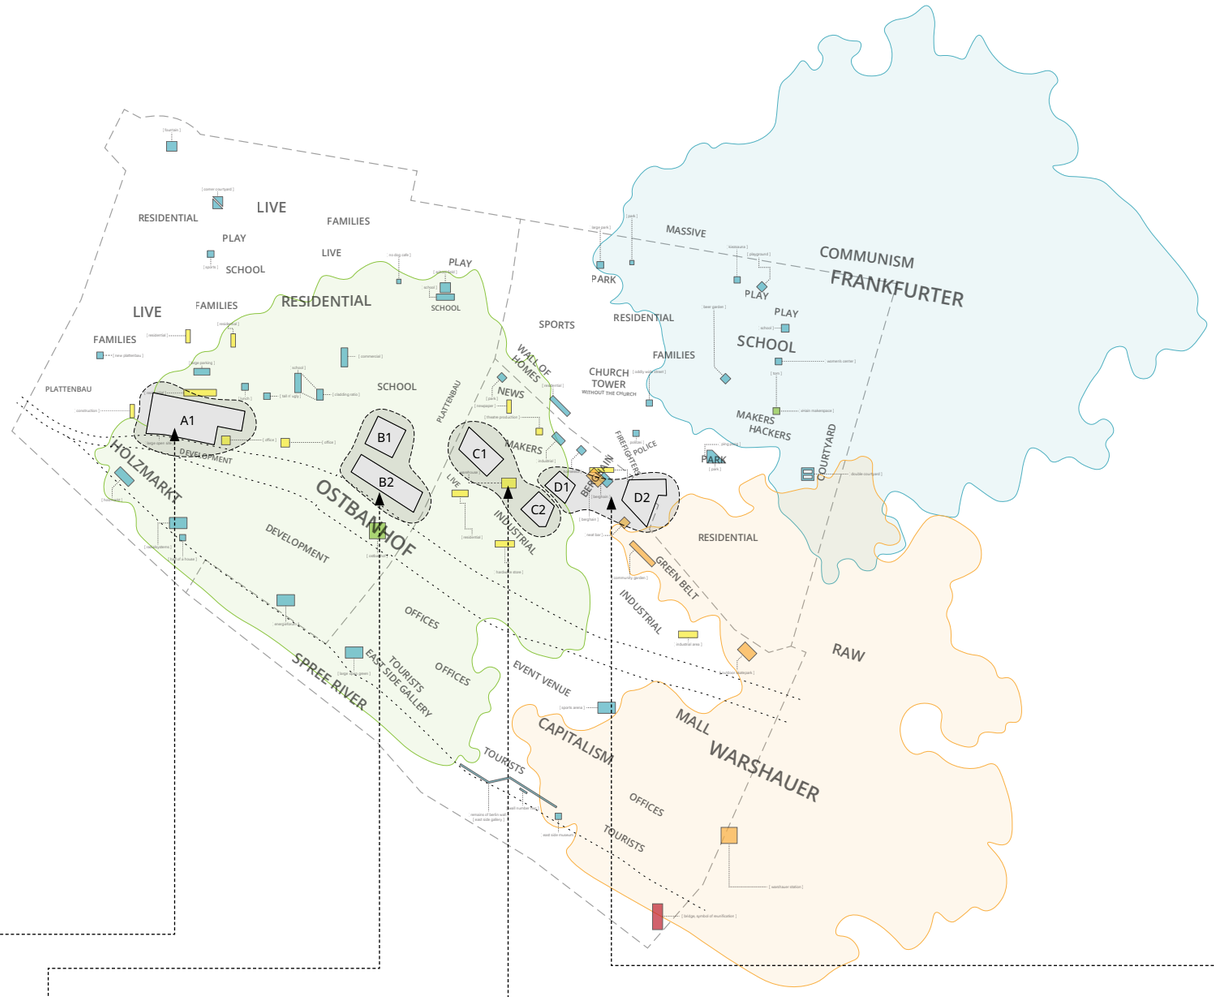
SITE SELECTION

WRIEZNER KARREE

SITE CONDITIONS MATRIX



A - MVRDV PLOT

A - MVRDV Plot

- Site area of 18000m².
- One of the very few large open plots within the assigned neighborhoods.
- The series of old foundations left on the site from old buildings is interesting and could prove a very interesting design driver. Acquiring detailed information about them seems difficult.
- Historical context of the area being destroyed following the war would have to be addressed.
- Intermittent noise from the adjacent train line would be a consistent concern.
- Potential to use the archway spaces beneath the railway.
- Site almost seems to large for the building we are asked to design.
- Primarily residential neighborhood
- Adjacent buildings between 25-50m.
- Construction underway on the plot to the west.
- Location lends itself to a 'social' and 'wellness' focused prototype.

B - OSTBANHOF PLAZA

B1 - Food Truck Parking

- Site area of 6000m².
- Varied context of relatively tall buildings.
- Currently this area of the neighborhood feels quite dead and borderline unpleasant.
- Seems to be occasionally used for events and has a number of food trucks indicating a need for food in the area.
- Parking could be included with plans to phase it out, tying into loose-fit.
- Extremely close to Ostbanhof station, making the site more accessible to those outside the immediate neighborhood.
- Primarily residential context.
- Location lends itself to a 'social' and 'wellness' focused prototype.

B2 - Ostbanhof Plaza

- Site area of 10000m².
- Three surviving buildings with commercial on the lower floor and residential on the upper floor.
- Getting information on these buildings to integrate will likely be challenging.
- A long site with green space on either end (east and west) providing opportunities to integrate these with the building program.
- Directly adjacent to Ostbanhof station.
- A cluster of smaller interventions seems more appealing here than a single building.
- Parking could be included with plans to phase it out, tying into loose-fit.
- Location lends itself to a 'social' and 'work' focused prototype.

C - RUNDOWN INDUSTRIAL

C1 - Refugee Hotel

- Site area of 18000m².
- Plot has two existing buildings on it. One a former hotel which is being appropriated as housing for refugees at the present moment, and a one story warehouse building.
- Residential building from the same era as the complex to its south which was renovated in 2008.
- Strategies for keeping these buildings could prove challenging due to a lack of usable information about their structure or layout.
- Context is a mix of residential, commercial, and industrial.
- Location is central to all three neighborhoods and easily accessible from Ostbanhof.
- Private theater production company to the north could form part of a creative complex for the city.
- Location lends itself to a 'social' and 'maker' focused prototype.

C2 - Industrial Island

- Site area of 18000m².
- Context is primarily industrial and commercial meaning noise is less of a constraint at this location.
- Location is central to all three neighborhoods and accessible from Ostbanhof.
- Private theater production company to the north could form part of a creative complex for the city.
- Location lends itself to a 'maker' focused prototype.

D - END OF PARK

D1 - Berghain South

- Site area of 18000m².
- Empty plot directly south of the Berghain building.
- Currently the site is occupied by a number of homeless people, and has been for a number of years.
- Context is primarily industrial and commercial meaning noise is less of a constraint at this location.
- Private theater production company to the west could form part of a creative complex for the city.
- Proximity to the green belt to the east provides opportunities to integrate into the park.
- With Berghain closing down the question of what happens to the larger site as a whole becomes something which may need to be addressed.
- Location lends itself to a 'social' and 'maker' focused prototype.

D2- Aldi Grocery Store

- Site area of 18000m².
- Site contains a one story grocery store and parking spot.
- Over 10min walk from the nearest train station, slightly more accessible by tram.
- Immediate context includes Berghain, a police station, a fire station, the primary commercial street in the area, and the long green strip to the southwest.
- Mix of residential, commercial, and industrial.
- Has a number of neighboring buildings with atypical / non-vernacular forms for the area.
- Location lends itself to a 'social' and 'wellness' focused prototype.

LARGE SITE
SOUTH ANDREASVIERTEL

Initially I was quite attacted to the large open site in the south of Andreasviertel. It's large open nature is suitable for a variety of uses and offers the potential to phase the project or integrate other buildings at an urban planning scale. The ruins on the site pose an interesting design problem, and the arched recesses below the train station a unique opportunity.

However, I feel the size of the site is at odds with the size of the program. Such a large site (1800m²) is better suited to a project with a larger footprint. Furthermore, early studies into sites and programs lead me to feel this site is better suited to series of uses which do not align with my interests from the studio.

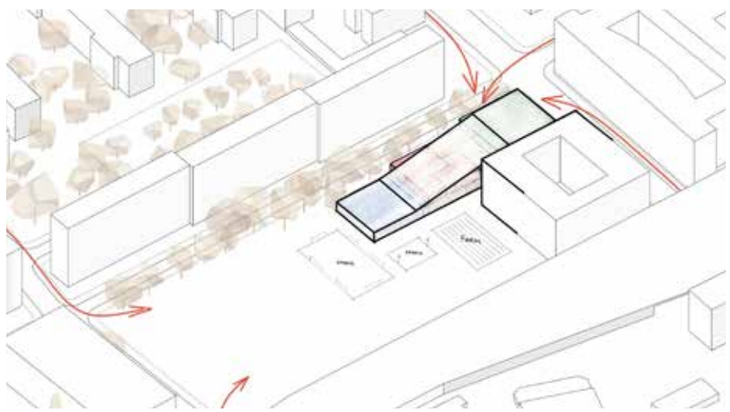
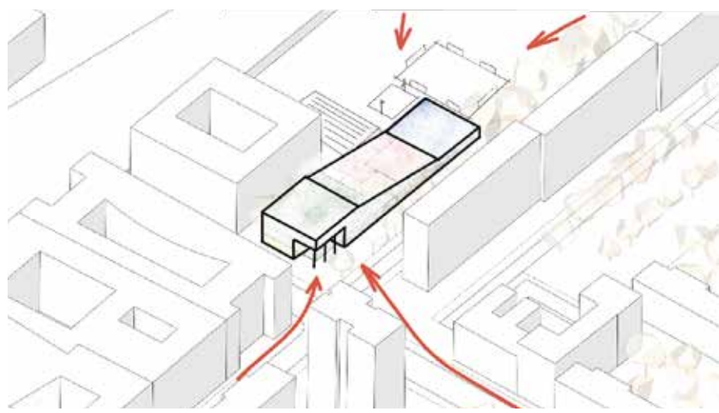
SITE PLAN & SHADOW STUDY



SOUTHWEST AXO SKETCH



NORTHEAST AXO SKETCH

LINEAR PARK
SOUTHERN WEBERWIESE

Situated at the foot or Berghain and the end of the elongated green space, the two highlighted sites are located in a more diverse area. They have the opportunity to make use of the park space to extend or augment the range and quality of services offered, possibly through a series of smaller interventions scattered throughout the park.
There are some notable differences between the two sites. To the south of Berghain, the smallest of the considered plots is currently inhabited by homeless people, and has been for a number of years now. Its location would offer more synergy with the theater production complex, Berghain, and the soon to be developed housing block to it's immediate south. The grocery store plot carries a lot of potential not maximized by the current usage, but ultimately with the similarly programmed RAW nearby and the relocation of the grocery store this site is among the less attractive of the ones studied.

INDUSTRIAL SITE

INTERSECTION OF THREE NEIGHBORHOODS

The abandoned island in the industrial section of Friedrichshain interested me the most during the excursion, and I feel still is the most suitable site for the design project. Looking at ways to incorporate the existing building on the westernmost plot in either whole or part is something I would find interesting. Not least because it fits with the theme of 'overwriting' that my project is dealing with so far. Given the warehouse building in the center seems to be unused it too could become a possible site for intervention, or an area for the building to expand into.

A stumbling block for reuse of any of these spaces will be getting drawings that can be used as reference when proposing reuse scenarios. Two options present themselves in finding the architects who did the renovations on the housing units directly south, or those doing the development on the block itself (GRAFT).

Charakteristische Knotenpunkte und Verbindungen

Die geometrische Gestaltung der Knotenpunkte der horizontalen und vertikalen Verbindungen erfolgte entsprechend den Grundregeln für Bauelemente der WBS 70. Die Wahl der zweckmäßigsten Knotenpunktausbildung war abhängig vom Entwurf, der Statik und der Herstellungstechnologie. Die charakteristischen horizontalen und vertikalen Knotenpunkte sind in den Bildern 2.2.7 bis 2.2.10 dargestellt.

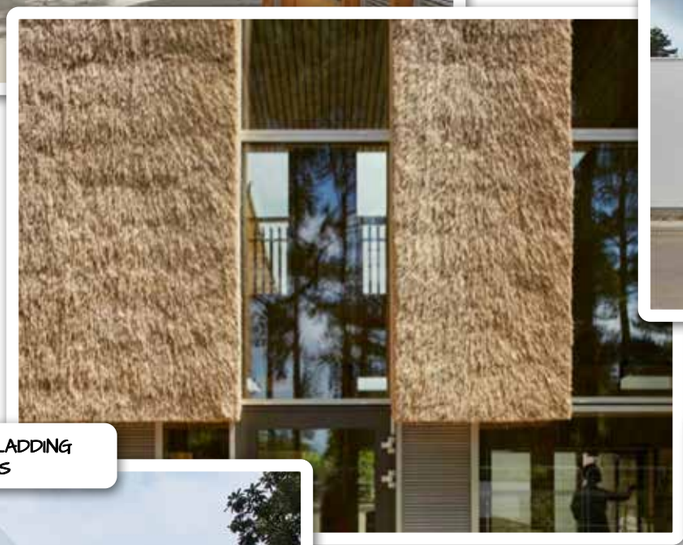
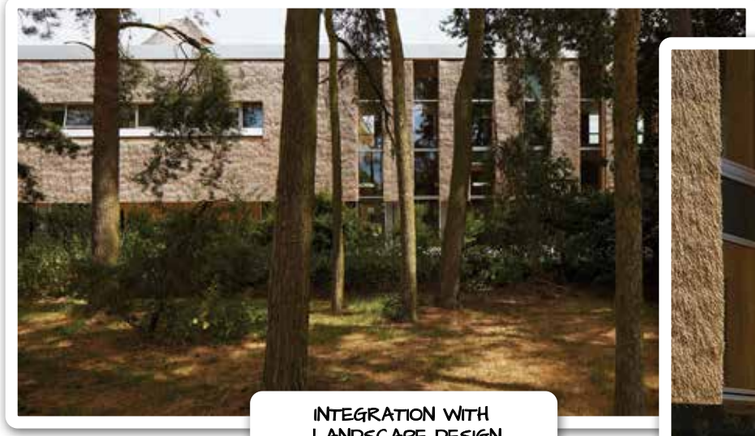
ARCHITYPE

- Projected lifespan of 100 years and serves as a paragon of low embodied carbon construction
- Its 3,400sq m floor space accommodates hatcheries and incubator units for SMEs and start-ups operating in the low-carbon sector, as well as an innovation lab, a 300-seat lecture theatre and flexible teaching facilities and workspaces.
- The need to keep embodied carbon to a minimum sparked a quest to identify suitable materials, particularly from local sources, that could fulfil the required aesthetic and functional criteria.
- Versatile properties of thatch [...] using it to create a bristling layer of rainscreen cladding on the facades. “In terms of impact and architecture, rainscreen cladding is often the first thing you see.”
- worked alongside local thatchers to develop a novel construction technique: prefabricated thatched cassettes were produced off site, which were later fixed to the framework using split battens.
- A spray-on cellulose product made from recycled paper acts as an acoustic dampener.
- Building made use of materials discarded from other projects, urban mining.
- The exhibition area functions as a versatile social workspace that stretches along the full length of the building and unites the two wings at either end. Dramatic changes in height and plenty of glazing give it a spacious feel, while pods projecting from the first floor are clad in a range of materials that promote the centre’s ecological credentials.
- As with most modern educational facilities, the building offers a range of working environments that can be adapted to different uses, as well as breakout areas and dedicated teaching spaces. The ground floor contains a variety of seminar and lecture spaces, alongside rooms accommodating student enterprises and a hatchery where small businesses can hire desks.

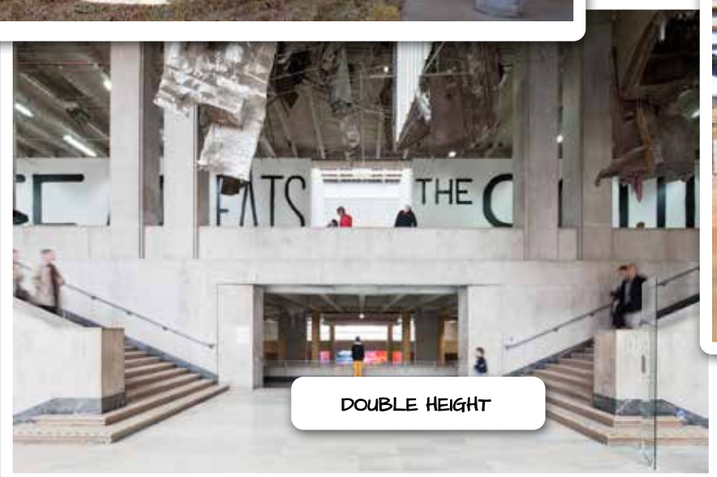




PALAIS DE TOKYO

LACATON & VASSAL

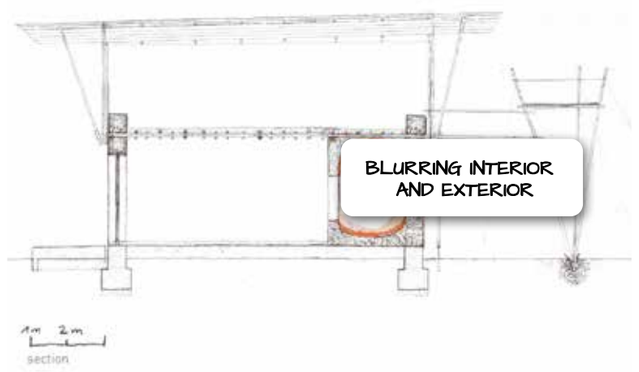
- Built in the 1930s, by the late 1990s the building was mostly abandoned following the move of the exhibits to other galleries.
- Stripped down structures that exposes and embraces raw materials. Allowed to age.
- Different atmospheres: lower levels are dark and gloomy, upper levels bright and sunny.
- Lack of dedicated routes, users are allowed (encouraged?) to wander uninhibited.
- Structure was reinforced where needed and left alone elsewhere.
- The section, in many places, deals with ideas of split levels, changing ceiling elevations, open (transformable space), and access to daylight.

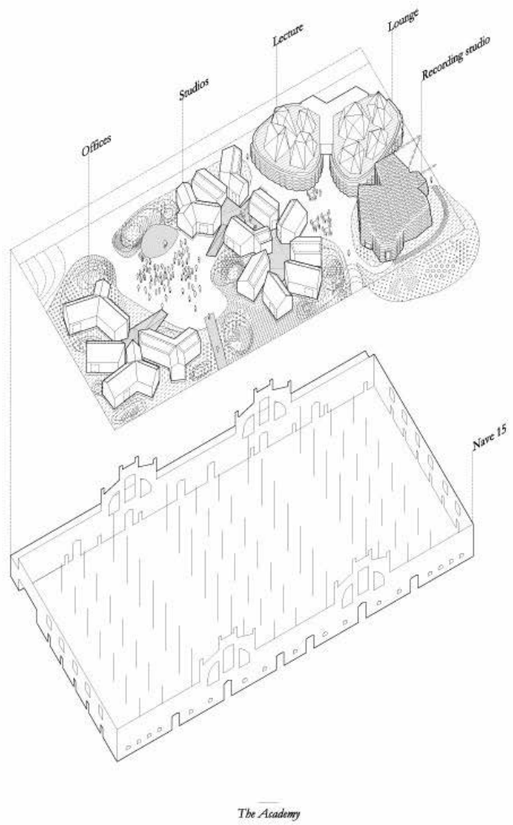


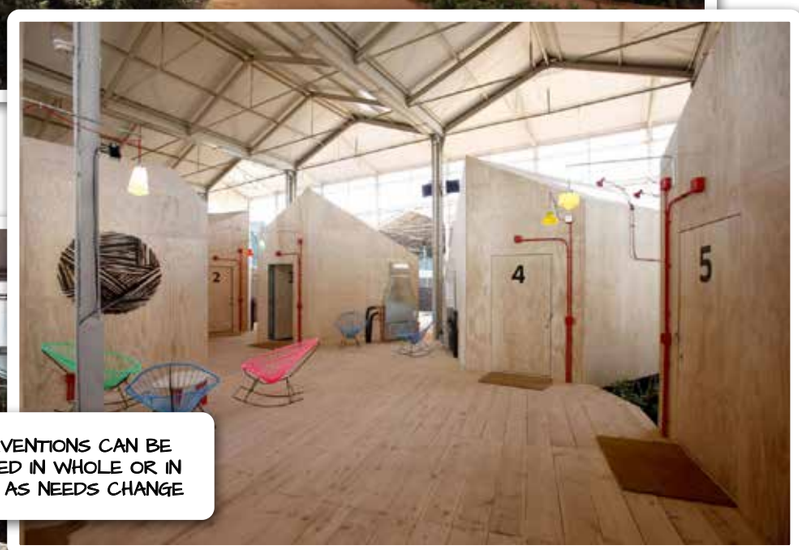
RED BULL ACADEMY
LANGARITA NAVARRO ARQUITECTOS

- The RBMA is a nomadic music festival, in 2011 it was hosted in Madrid on short notice due to earthquakes in japan.
- Intended as a medium-term project, the project was designed as a temporary and reversible (demountable?) for ease of reconfigurability.
- Focus on specific needs (acoustic and technical) for the event, as well as facilitating artistic encounters (!) between the invited musicians.
- Five guidelines:

1. Deadlines and budget: light construction, balance between standardization and adaptability.
2. Making no non-revesible changes to the warehouse space in Matadero.
3. Program was driven by specific event requirements: construction methods would allow for different events to reconfigure structures as needed.
4. Acoustics: some interventions were specific based on the usage, some generic (mass, cloth).
5. Temporari-ness: can be removed without a trace, repurposement of materials considered.





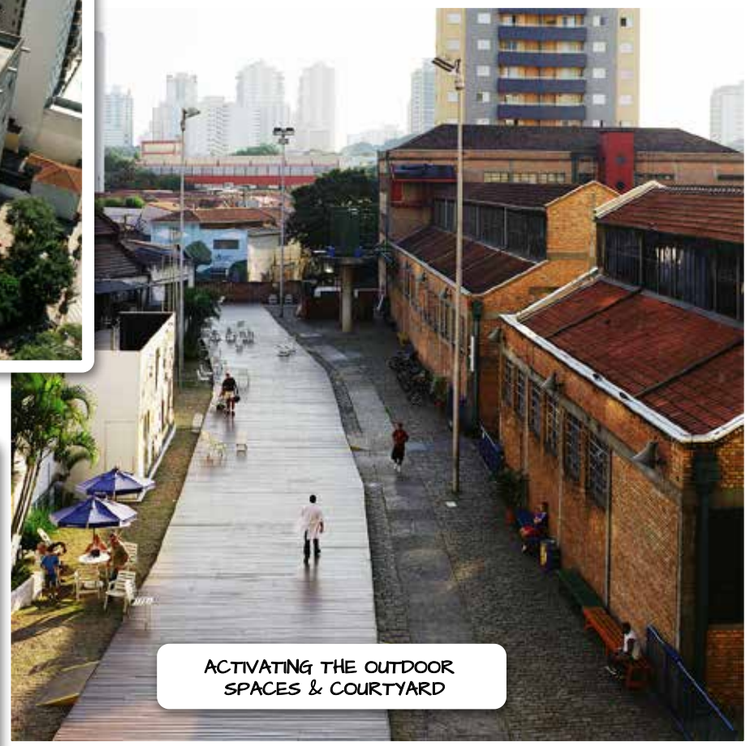


SESC POMPEIA

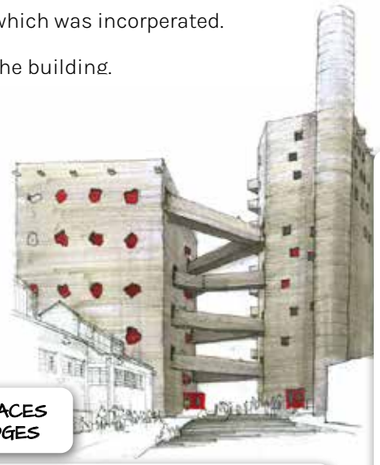
LINA BO BARDI

- Three primary volumes, one big tower, one small tower, and one circular tower.
- Windows show pattern of the styrofoam molds, concrete shows pattern of wooden molding.
- Concrete and pre-stressed concrete elements made up the structure of the building.
- Importance of pedestrain access and connection to the surrounding streets.
- Project was built around the renovated drum factory which was incorperated.
- Internal street a holdover of the previous function of the building.

CONCEPT OF EXISITING AND NEW BUILDINGS

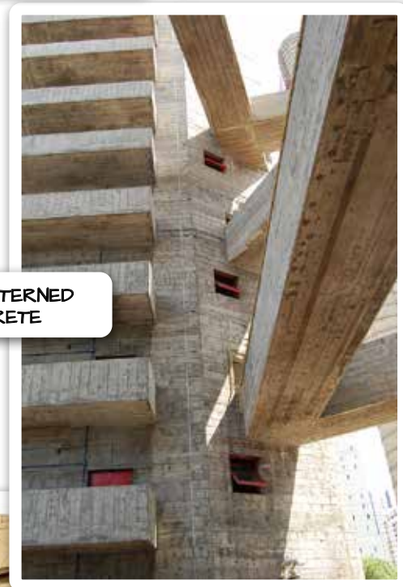


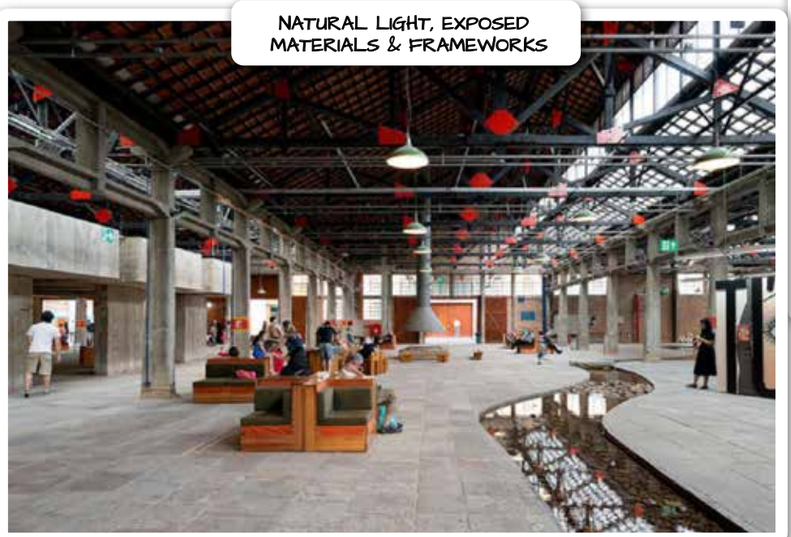
ACTIVATING THE OUTDOOR SPACES & COURTYARD



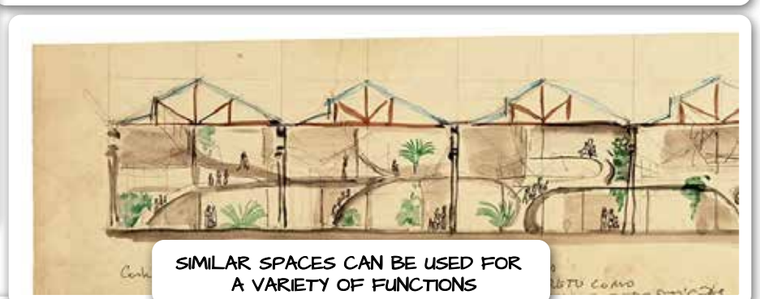
CONNECTING SPACES THROUGH BRIDGES

WOOD PATTERNED CONCRETE

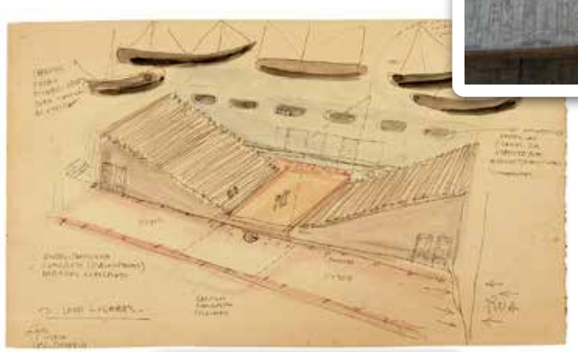




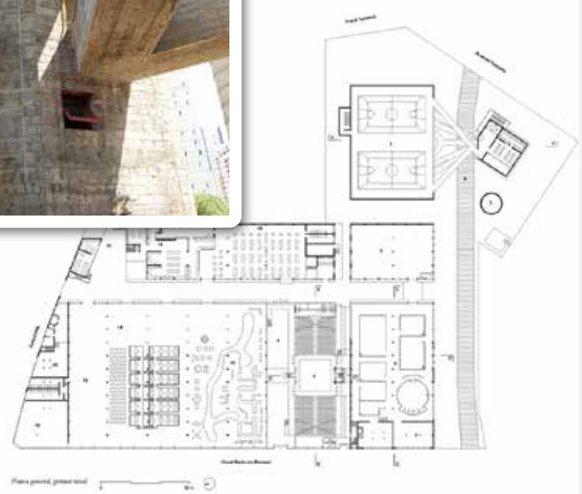
NATURAL LIGHT, EXPOSED MATERIALS & FRAMEWORKS

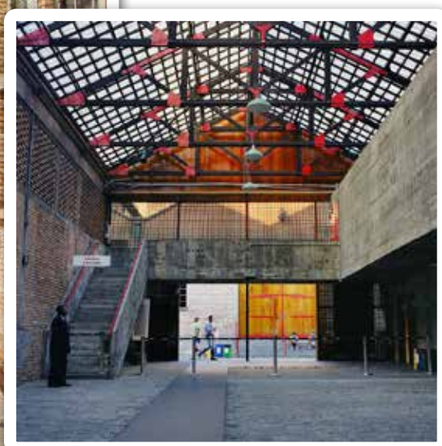


SIMILAR SPACES CAN BE USED FOR A VARIETY OF FUNCTIONS



STAIR OR AMPITHEATER STRUCTURE





YARDHOUSE
ASSEMBLE STUDIOS

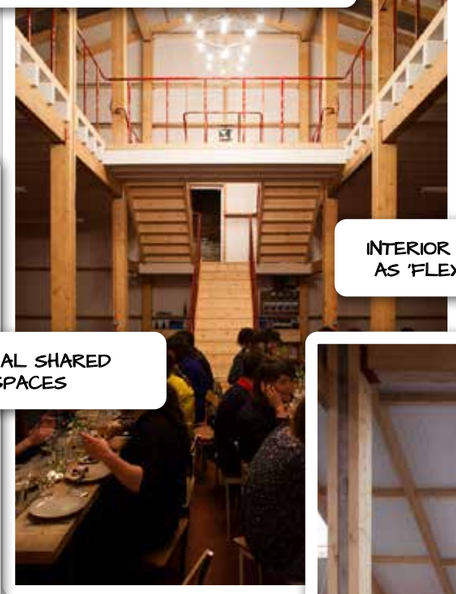
- Affordable creative workspace building. Demountable and moveable.
- Social and collaborative work environment. Skill sharing and community learning.
- Studio 'plots' were provided without partitions, leaving tenents to adapt the space to their needs.
- Structure is a mix between heavy timber and timber framing. There are no load bearing walls, and tenents can attach partitions and other elements onto the existing structure.
- Handmade colorful concrete tiles clad prefabricated insulation panels. 'Bespoke'.
- Highly affordable due to construction methods and materials (£291/m^2) (total costs under £80,000) (2012). Built using standard material dimensions. This also has the benefit of easy repair and replacement. Replocatable without specialist trades.
- Materials are left exposed.
- 3.5 to 4.5m ceiling heights allows for good natural light and expansion via mezzanine storage

IDENTIFYING OBJECTS MADE FROM SITE MATERIALS

Feedback has indicated that many tenants were very excited by opportunity to be part of the creation of a new creative community and that the flexibility and adaptability of spaces was a major selling point. In this respect many tenants saw us as an alternative to London's larger studio providers who do not grant their tenants as much flexibility and control over their studio space. Many applicants were also attracted by the collaborative nature of the project and the additional facilities available on site. This is an element of the project that we believe would be particularly valuable to expand on future sites. For many emerging creative practitioners, access to tools and facilities can be a major financial barrier to pursuing individual work. Partnering the provision of affordable workspace with more established lead tenants who have the financial capital to invest in facilities, or with independently provided workshop facilities can be a major boost for smaller tenants and can give greater financial viability for larger tenants to invest in tooling.

REPRODUCABLE BUILDING SYSTEMS

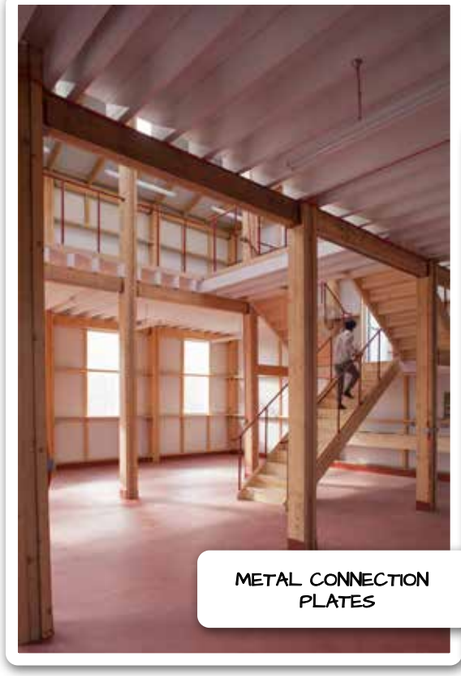
INTERIOR SERVED AS 'FLEX' SPACE



CENTRAL SHARED SPACES

SIMPLE EXPOSED MATERIAL

TILES SERVED AS A UNIQUE IDENTIFIER



METAL CONNECTION PLATES

Flexibility - Studio plots The building is constructed without internal walls. Each structural bay of the building, measuring 4m x 3m, was treated as a studio 'plot', where tenants would be able rent 1,2,3 or 4 adjacent plots to create the studio size of their preference and pay the corresponding square metre rate. This meant the layout and size of the studios could respond directly to demand, reducing the risk of unlet space and offering tenants the opportunity to only pay for as much space as they needed. Studio plots were provided in a basic state with no partition walls or furnishings, leaving it up to the tenant to 'complete' the space in an appropriate way for their practice. Allowing tenants to build their own walls had the significant benefit of creating a more affordable end product since tenants are able to build at a cheaper rate than would have been possible for a contractor. Giving tenants some hand in the construction of their space also has considerable benefits for the sense of community in the building, giving a much greater degree of ownership and control.

MEDIA LAB PRADO

LANGARITA NAVARRO ARQUITECTOS

- “Promotes **production as a permeable process**, supplanting the figure of the spectator with that of the actor, or the figure of the **mediator as a facilitator of connections.“**
- Co-existance between old and new, halfway point as an open, versatile process activated by its users.
- Using and celebrating the existing factory building. Made of lightweight reinforced concrete (1920s), efforts were made to avoid create similar spaces to those already existing.
- Non-specific appoach to spaces, resulting in a homogenous approach to materials and uniform sitribution of installations. (similar service requirements throughout?).
- Different levels of change through time. Lightweight materials and systems suited for dissasembly and reuse.
- Searching for opportunities to provide supporting functions (multiplicity).

PERSONA	BACKGROUND	GOOD POINTS IN AREA	PAIN POINTS IN AREA
 **ELINA & THOMAS**	Elina and Thomas moved to Berlin five years ago from France because of Berlin's prominent reputation for the arts. Elina works as a coordinator and event organizer and Thomas is ceramic artist and musician. They don't know how long they want to stay in Berlin, and worry that the rising cost of living might make the decision for them.	• Berlin exceeds their expectations as a cultural city. • They enjoy the enthusiastic nightlife. • Easy to meet others temporary Berliners, particularly in the central districts.	• Rising cost of living is pushing them to work longer hours in order to make ends meet. • Thomas is finding it difficult to maintain his studio space and is considering splitting it with another artist to reduce costs.
 **ELLA**	Ella is a mechanical engineer and product designer who moved to Berlin from her hometown of Munich. Passionate about environmental activism, professional development, and food, she has struggled to meet like minded people and collaborators over the lockdown.	• Berlin's outspoken nature aligns more closely with her social and political beliefs. • The number of families in the neighborhood gives confidence in starting her own in the area. • Enjoys tending to community garden in Weberwiese.	• With much of her time occupied by work, she finds few opportunities to meet people in Friedrichshain. • She dislikes the lack of restaurants in her area. • Is often annoyed at the number of tourists and foot traffic near her apartment along the Spree.
 **THE ROMERO FAMILY**	The Romeros are a family of Argentine immigrants who relocated to Berlin late last year. The father, Fernando, trained as an architect but his degree is not recognized in Germany. The entire family is taking German lessons in order to assimilate to their new home. Their daughter, Sofia, hopes to become a fashion designer.	• Grateful for the opportunity to move to a more economically stable nation. • Happy to find diverse demographics, including other spanish speakers.	• Despite being a skilled professional, Fernando will have to either go back to school or learn a new profession in order to work in the country. • They often struggle with the unfamiliar language.
 **ADELE**	Adele has lived in Friedrichshain since before the fall of the Berlin Wall. Following the death of her late husband, she has rekindled her interest in gardening, but lacks much space in her small back yard. She has a number of friends in the area whom she meets with regularly.	• Adele finds her fondness for the area tied mainly to its history and her own experiences. • She enjoys volunteering at the nearby school where she worked as a German teacher.	• Adele has little fondness for the cultural scene of her city. She finds the music, vandalism, and attitudes of the younger people distasteful. • There is difficulty in finding meeting places for her and her friends in the area to meet that are accessible and quiet enough for conversation.
 **TIM**	Tim is a retired Australian set designer and prop maker who moved to Berlin to live with his partner ten years ago. Through his work Tom has lived in a number of major cities, but considers Berlin the one that best fits his current needs. He is active in the local makerspace community, xHain, where he works on his own projects and gives guidance to a younger generation of makers.	• Tom finds Berlin to be an incredibly diverse, welcoming, and caring city. • Is stimulated by the world around him and finds joy in seeing people follow their passions. • Enjoys being able to share his knowledge and experience with the younger generation.	• Worries that the current housing shortage and gentrification will change the demographics of Friedrichshain into something less interesting. • Worries about the reliance on technology among young people.
 **THEO**	Theo used to work as a senior developer. After struggles with substance abuse and homelessness, he has rebuilt his life and now works remotely. In an effort to change to a more hands on career, possibly in the trades. He actively volunteers in an effort to support those in similar situations to his past.	• Thoe finds Berlin to be a caring and generous city. • He identifies with the counter-culture culure of Berlin and its nightlife. • Wants to find his own way to help people struggling with drugs and alcohol.	• Theo is concerned that the gentrification taking place in Friedrichshain risks pushing many people out of their communties.

PROGRAM DEVELOPMENT
PROGRAM DEVELOPMENT

BERLIN 2030 URBAN DEVELOPMENT PLAN - FUTURE

- Strengthening the economy with smart knowledge
- Improving accessibility and city-friendly mobility
- Unleashing strengths through creativity
- Shaping the future together
- Laying the groundwork for a climate-friendly metropolis
- Safeguarding employment via education and skills
- City and green growing together
- Reinforcing neighbourhood diversity

BERLIN 2030 URBAN DEVELOPMENT PLAN - TODAY

- Dynamic capital with global reach
- Innovative economic and scientific hub
- Metropolis with enourmous untapped land potential
- A place for everyone to explore their creativity
- Green and compact city
- Caring, inclusive and socially responsible city

FUTURE PLANNING THEMES

- TECHNOLOGY & INNOVATION
- ECONOMY & EMPLOYMENT
- CREATIVITY & CULTURE
- EDUCATION & SKILL AQUISITION
- COMMUNITY & DIVERSITY
- HEALTH & WELLNESS
- SUSTAINABILITY

POSSIBLE PROGRAM ELEMENTS

- **Coworking Spaces** — Collaborative working spaces.
- **Startup Incubator** — Office spaces for young businesses and start-ups.
- **Rental Office Space** — Typical office space, offset cost of the building.
- **Artist Studios** — Artist workshops and studios to rent.
- **Artist in Residence** — Artists live and work on site.
- **Performance Spaces** — Practice and performance areas for artists.
- **Exhibition Spaces** — Artist exhibitions & community work.
- **[Maker & Hacker] Space** — Community workshop and Hackerspace.
- **Graffiti Spaces** — Space for street art to be performed.
- **Teaching Studios** — Program specific education spaces.
- **Auditorium** — Holds lectures, workshops, or town halls.
- **Event Spaces** — Flexible spaces capable of hosting events.
- **Food / Beer Hall** — Sharing of ideas and culture.
- **Fitness Area** — Interior or exterior space for physical fitness.
- **Sports Facilities** — Fields, courts, pools, or other infrastructure.
- **Rock Climbing** — Interior area for rock climbing or bouldering.
- **Community Garden** — Land that can be used to host a community garden.
- **Energy Generation** — Elements intended to reduce carbon impact.

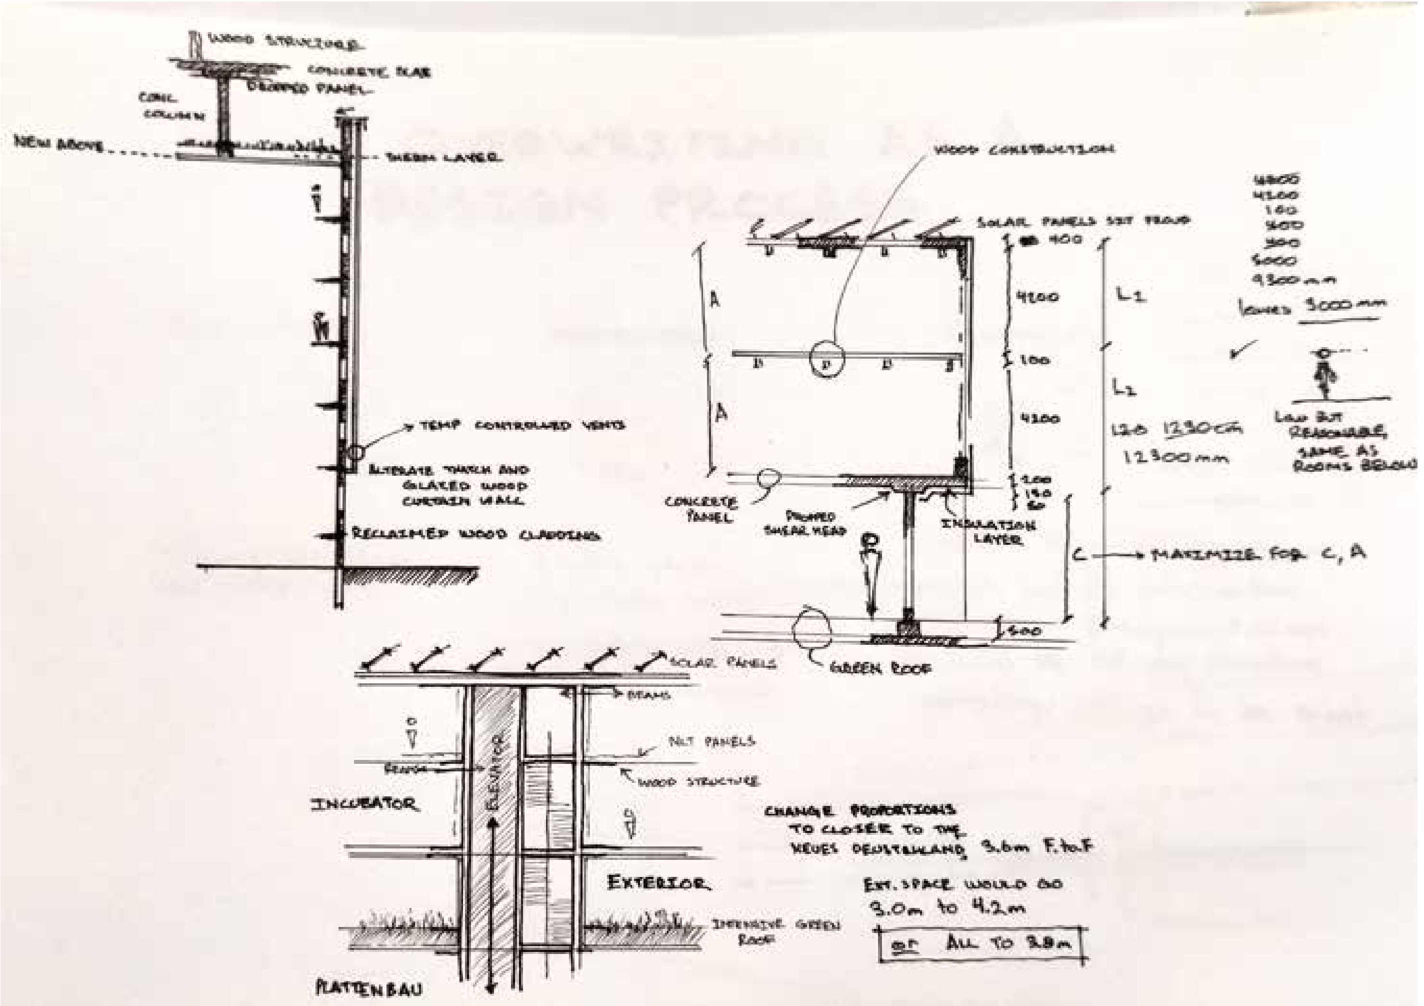
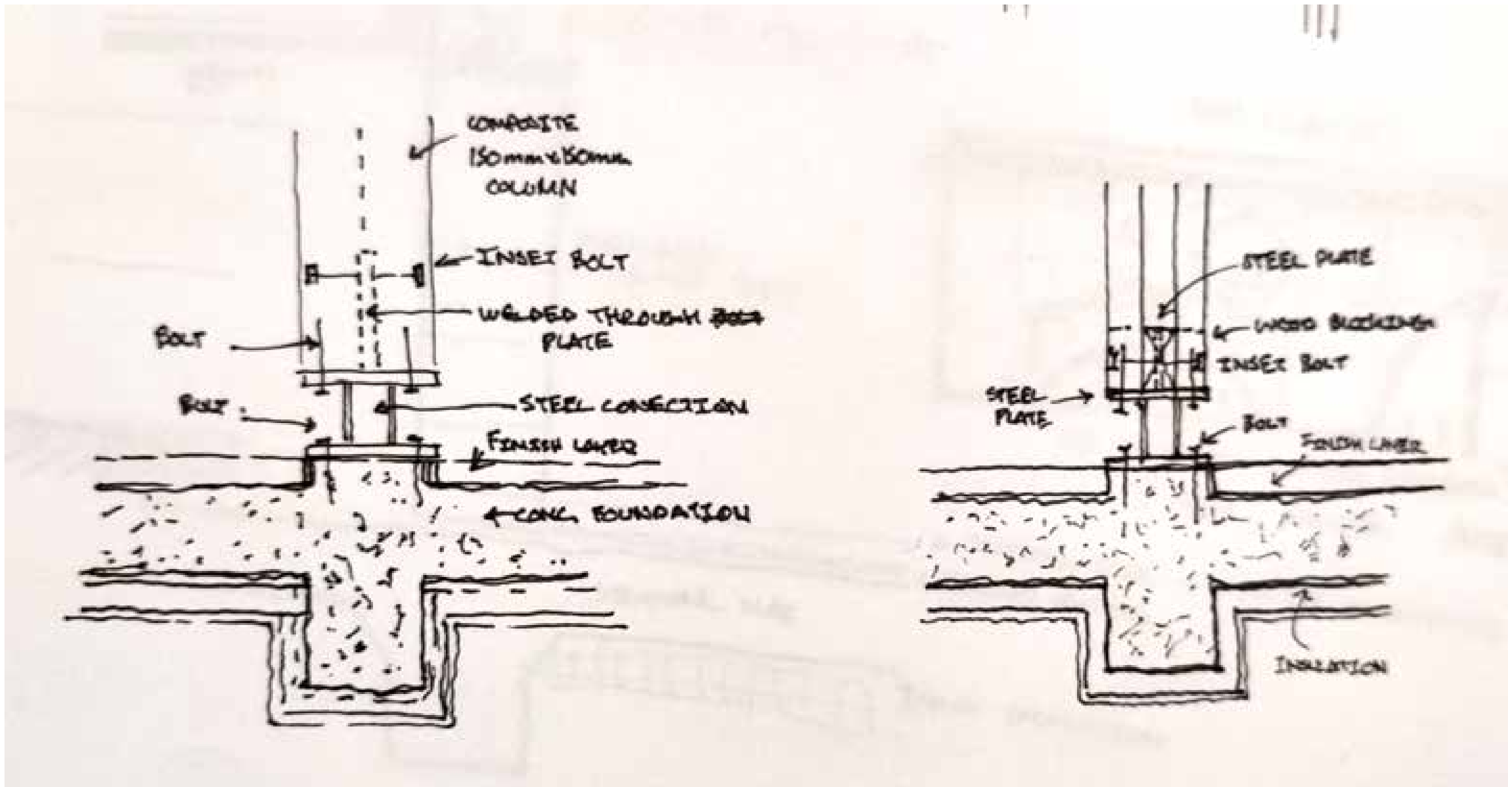
OVERWRITING AS A DESIGN PROCESS
BASE BUILDING
simple system as a base, clean slate
MODIFICATION
program placed (urban living room) with sunken areas for seating and cushions
REPURPOSEMENT
program is moved/shrunk/removed, but the intervention remains. a playground comes in, and the tall play structure necessitates ceilings to be raised
this space is now unique and remarkably contains traces of former uses, which are included in the design drawings



WOOD STRUCTURE
CONCRETE SLAB
DROPPED PANEL
NEW ABOVE
WOOD CONSTRUCTION
SOLAR PANELS
TEMP CONTROLLED VENTS
ALTERNATE THATCH AND GLAZED WOOD CURTAIN WALL
RECLAIMED WOOD CLADDING
CONCRETE PANEL
DROPPED SHEAR HEAD
INSULATION LAYER
MAXIMIZE FOR C, A
GREEN ROOF
INCUBATOR
ELEVATOR
EXTERIOR
CHANGE PROPORTIONS TO CLOSER TO THE NEUES DEUTSCHLAND 3.6m F.to.F
EXT. SPACE WOULD GO 3.0m to 4.2m
or ALL TO 3.8m
INTENSIVE GREEN ROOF
PLATTENBAU



COMPOSITE 150mmx150mm COLUMN
INSET BOLT
WELDED THROUGH PLATE
BOLT
STEEL CONECTION
FINISH LAYER
CONC. FOUNDATION
STEEL PLATE
WOOD BLOCKING
INSET BOLT
BOLT
FINISH LAYER
INSULATION
