Program Description
The main implementation part consists of a program named "CityGML2IFC.py" it is a script file written in Python 3. When compiled the program will convert a source file in CityGML to a destination file in IFC.
License
and the program is licensed under General Public License v3.0

Participation
It is made with the help of Kavisha Kumar <https://3d.bk.tudelft.nl/kavisha/>.
Kavisha's Github <https://github.com/kk1mmy>.

Used Modules
The following modules are imported and used in the program; these modules should be preinstalled before running the program:
xml.etree.ElementTree _ Is used here for parsing the XML data
os _ To interact with the operating system where the computer is running for example: reading time and file path.
time _ To read the current time and stored in the created IFC files
itertools _ Is used to create a hashtagged unique id with an incremental value starting from a given value
sys _ Is used to allow files to be written on the hard disk
numpy _ To perform mathematical operation such as finding minimum value or subtract arrays
uuid _ To automatically generate unique IDs
pyproj _ To convert the resulting files projection

How to use program
1- Make sure that python 3 is installed.
2- Make sure all the necessary modules are installed, particularly:
a. numpy
b. pyproj
3- Download the program CityGML2IFC.py
4- the program will convert a source file in CityGML to destination file in IFC.
5- Change the name of your source CityGML file to: "Source.gml"
6- Compile (Run) the program CityGML2IFC.py.
7- A file called Result.ifc will appear. This file is the result of the conversion.
8- Check Result.ifc on the BIM software of your choice.

Question

Answer

Were you able to open the data?

100%

Data helpful?

80% Yes

20% Maybe

How can the data Help?

1- To exchange 3D-data between GIS and BIM.

2- Give a context to design & Visualization

How to improve?

1- More detailed information

2- Including terrain model

3- Metadata enrichment

4- when its defined as element can be used for structural and environmental simulations in BIM environment

Limitations ?

1- Base level of all buildings is the same

2- Not possible to edit the file after the transfer
