

**Adaptive reuse of landscape heritage:
a promising future for improving elderly people's
quality of life in shrinking area**

Shrinkage - a global problem

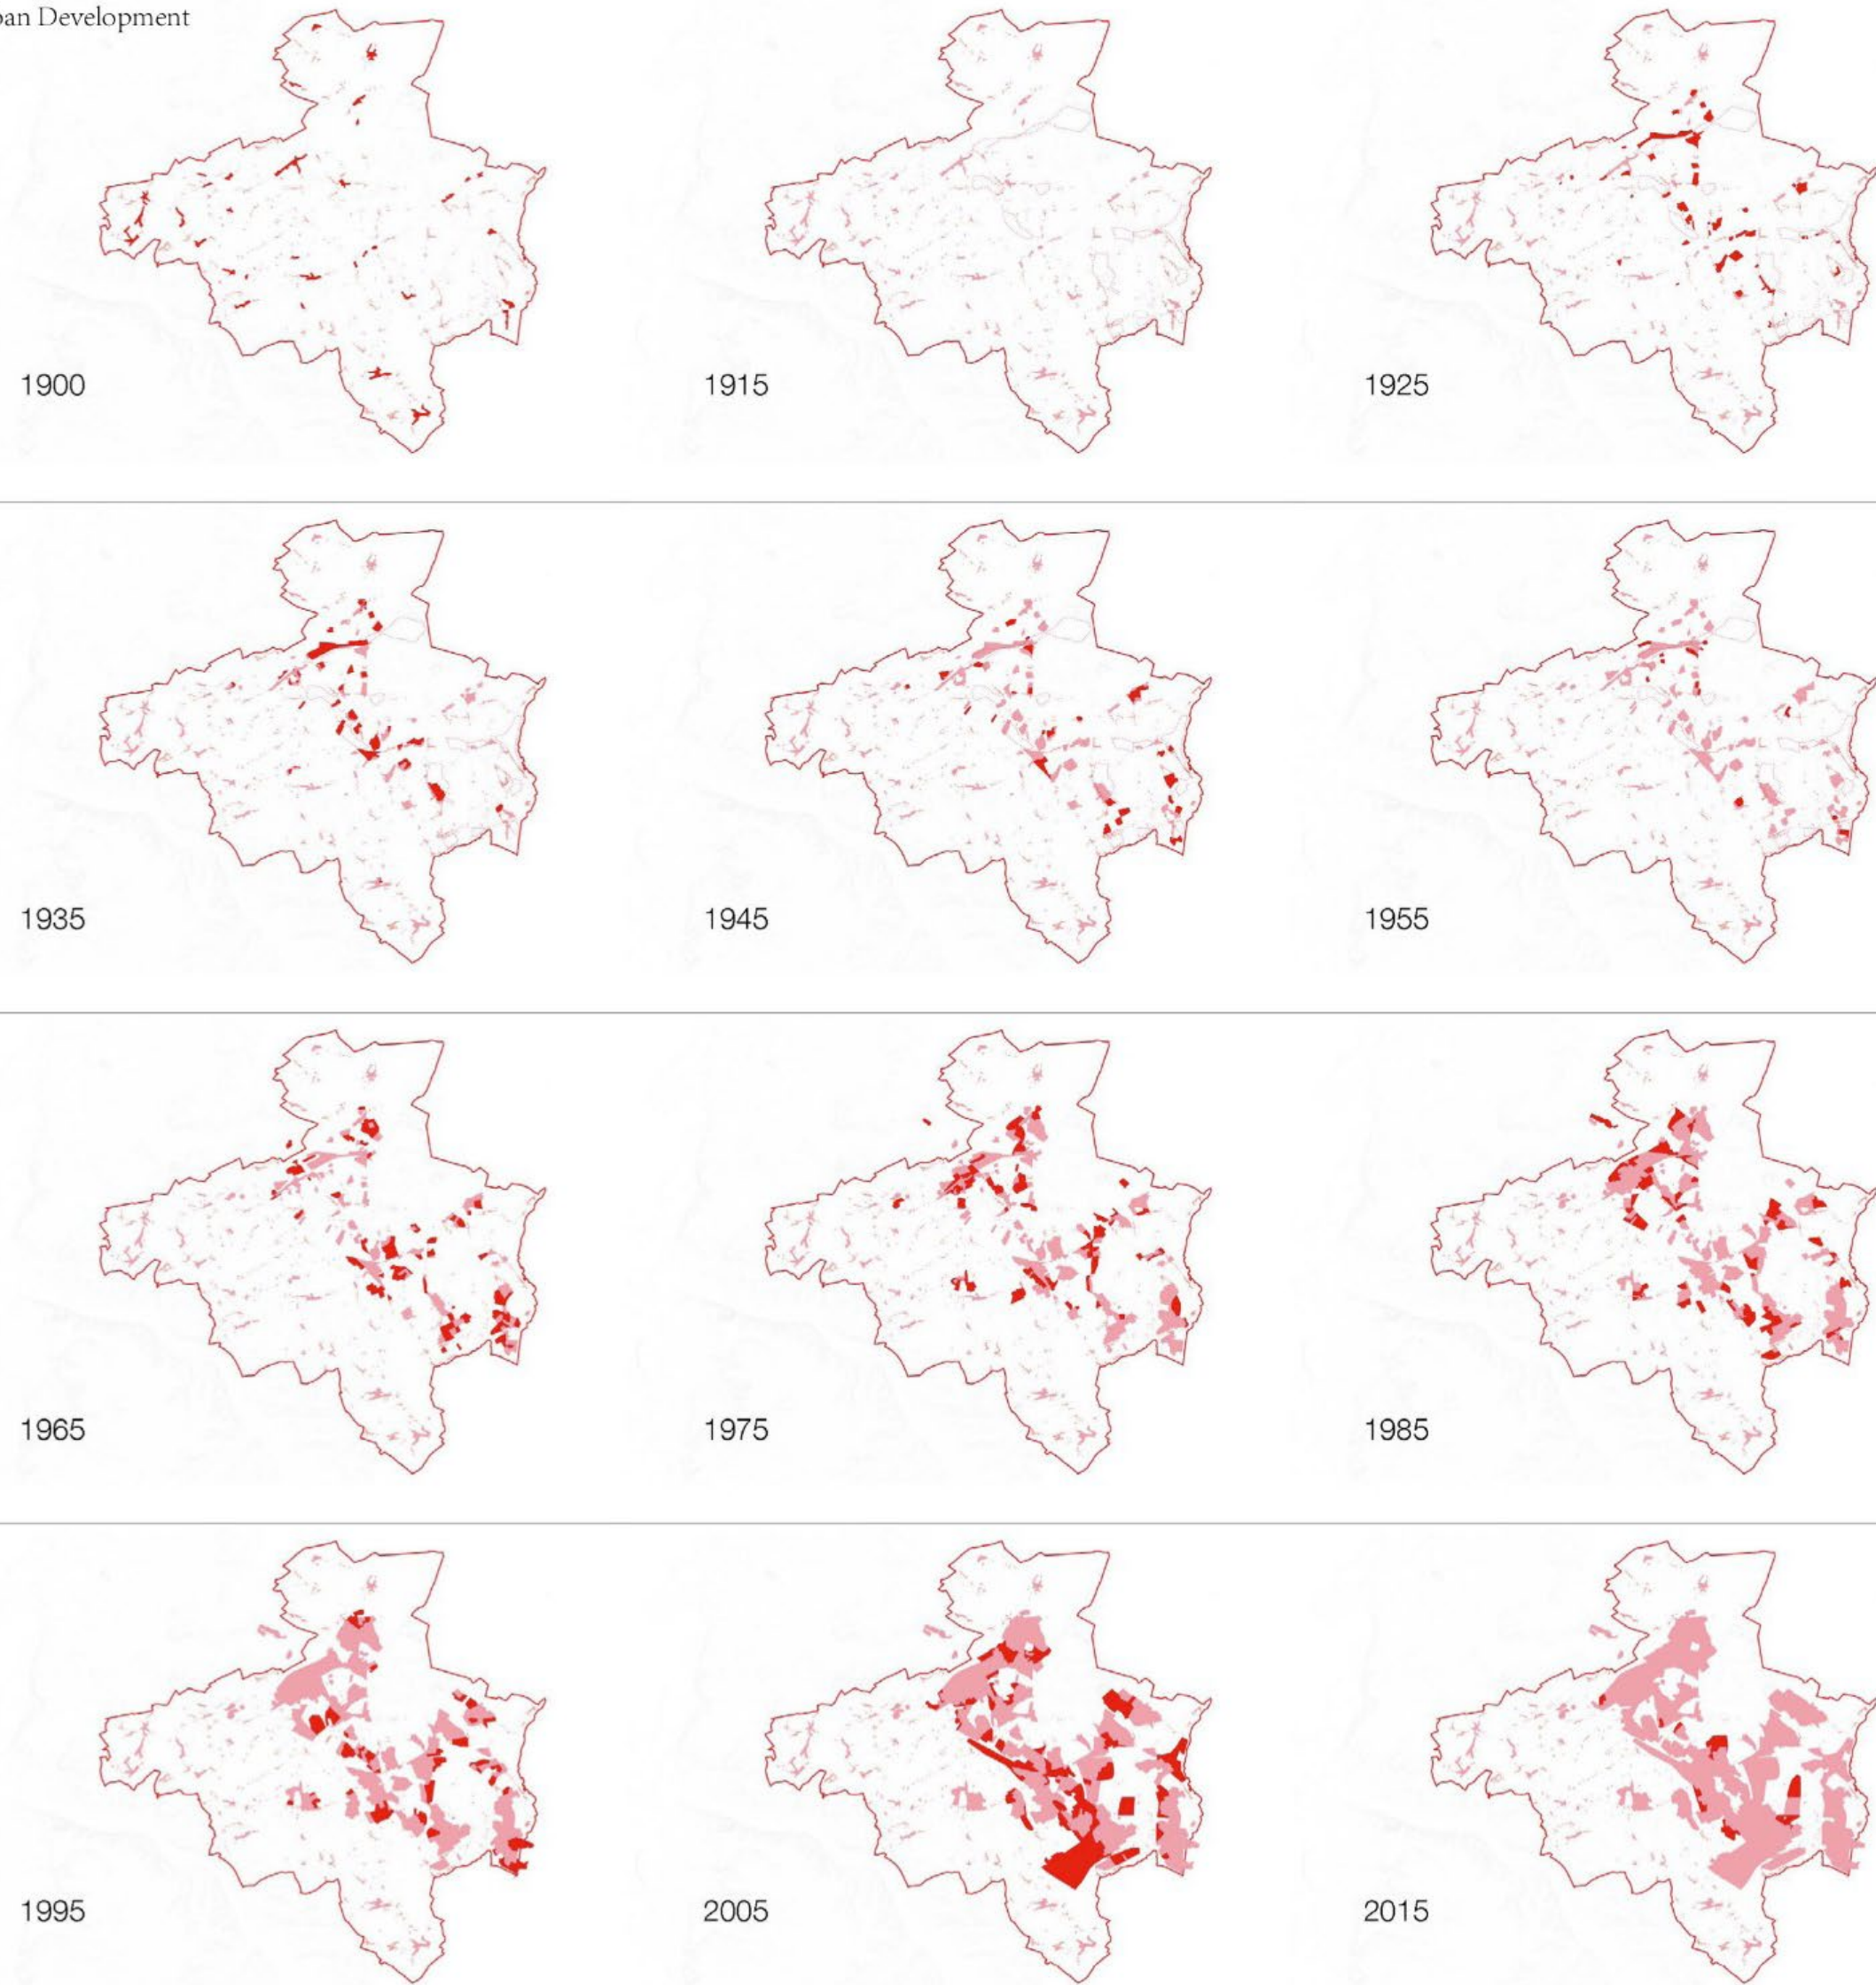

economic agglomerations in western Europe

inhabitants per km²

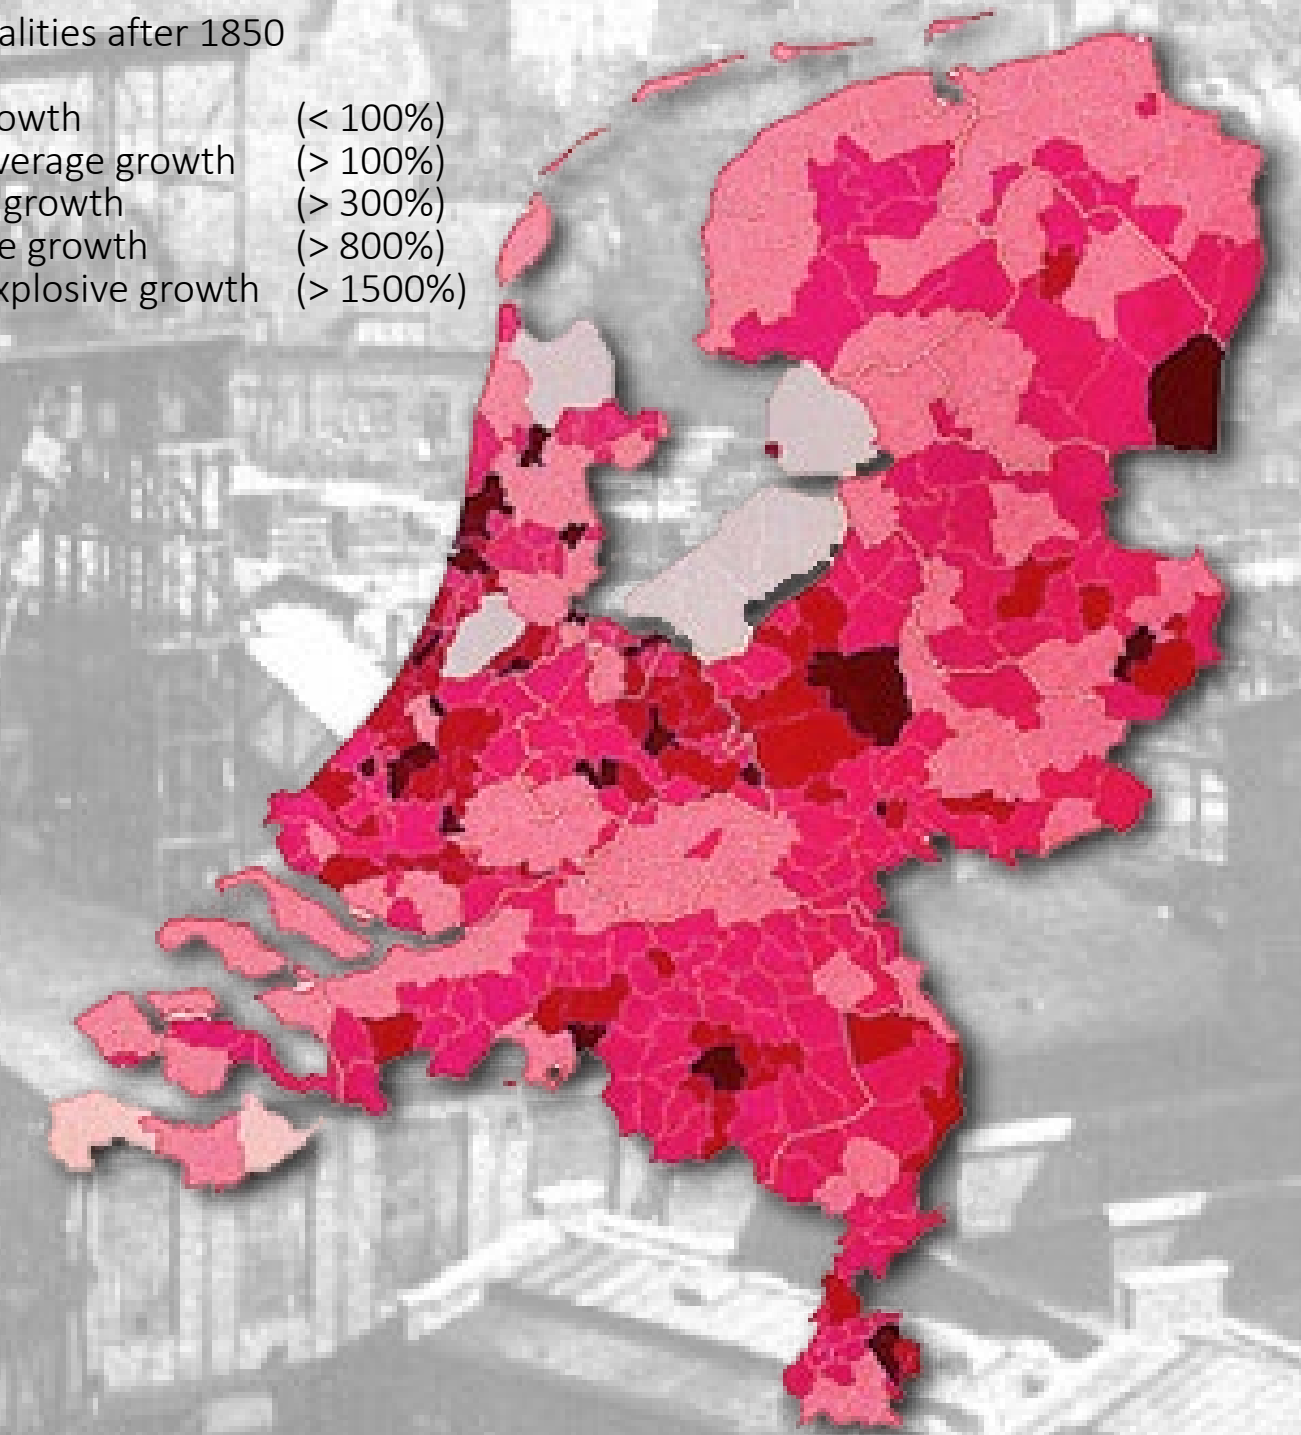

phenomenon of shrinkage

Urban Development

population growth in 1850 - 1999

- municipalities after 1850
- slight growth (< 100%)
- under average growth (> 100%)
- average growth (> 300%)
- explosive growth (> 800%)
- highly explosive growth (> 1500%)

source: Bevolkingsatlas van Nederland

phenomenon of shrinkage

1967
aprx. 28,000 direct jobs were lost, the remaining 17,000 workers waiting for employment.

1967
6 of the twelve coal mines closed

1971
the number of commuters to Belgium and Germany rose to 17,000

1971
mine closure ON II

1974
only 14,000 new jobs were created in South Limburg, lower than expected

1973
mine closure ON III

1974
last load of coal was brought up from ON I

1978
8 % of the workforce was unemployed, twice of the national figure

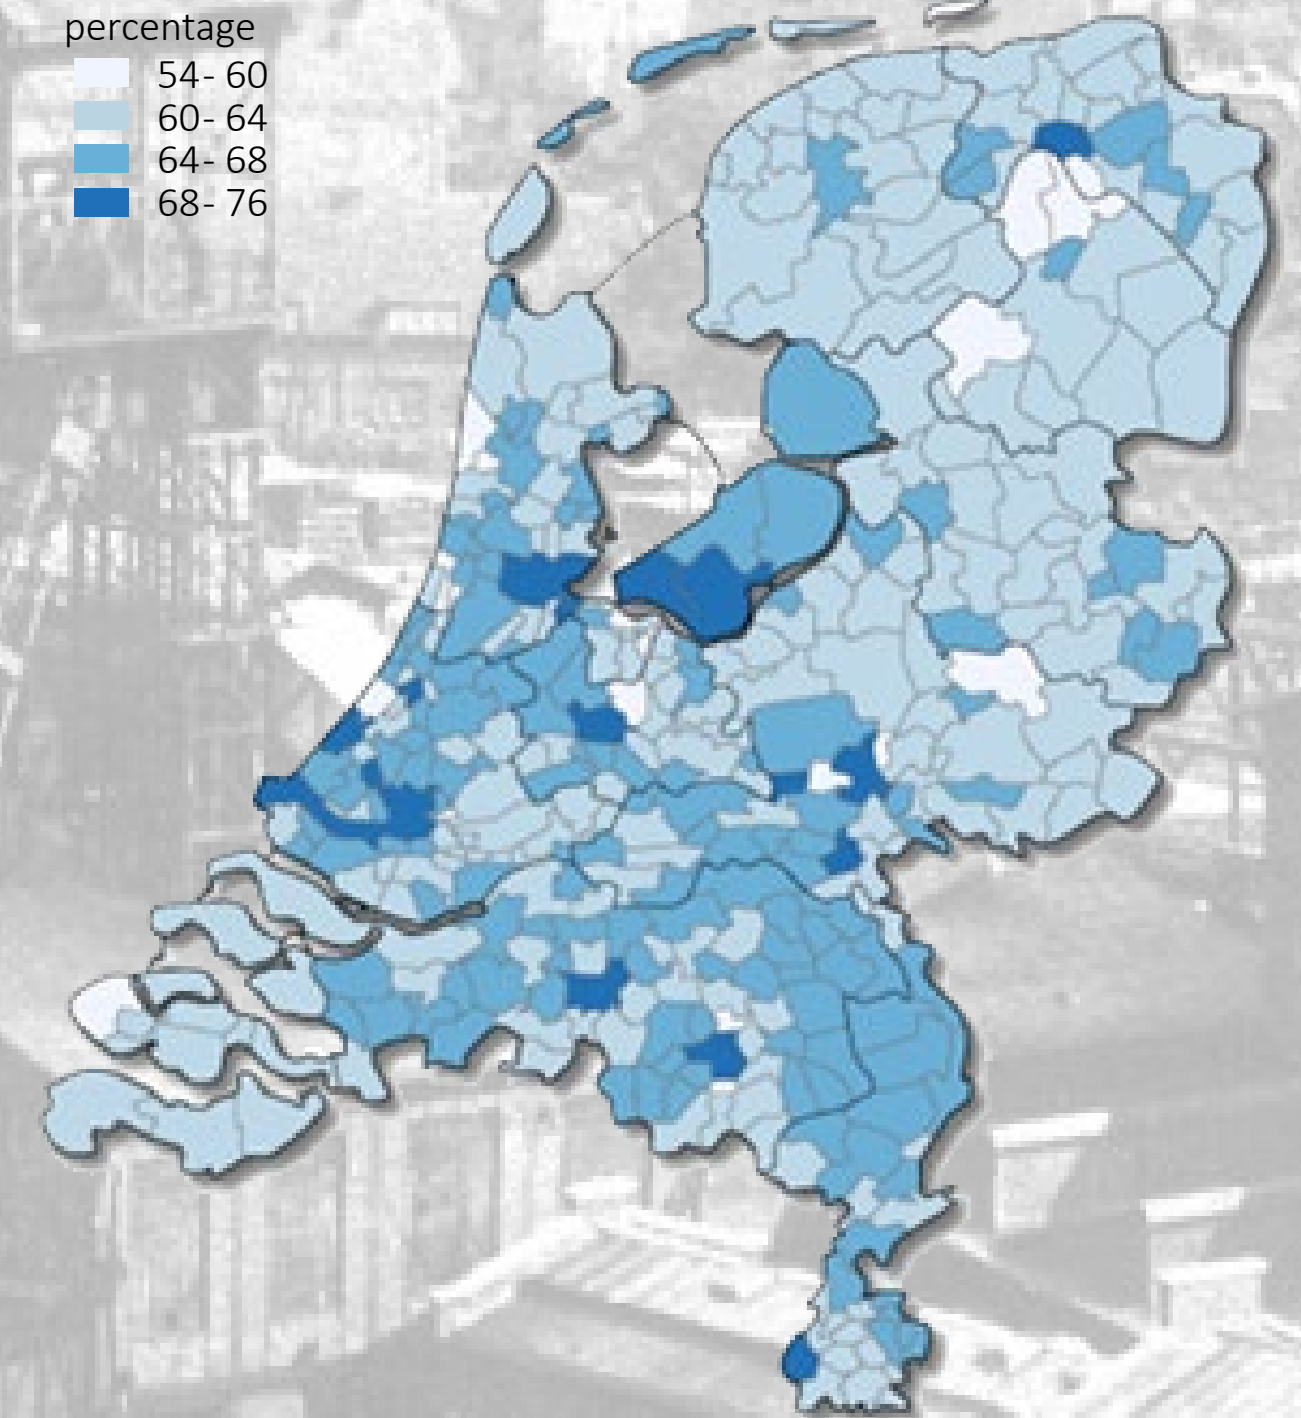

1980
unemployment reached post-war record

1985
unemployment for men was decreasing

1989
unemployment was slowly but surely being reduced

percentage of labor force 2015

scope - aging and healthcare

impression of green care farm

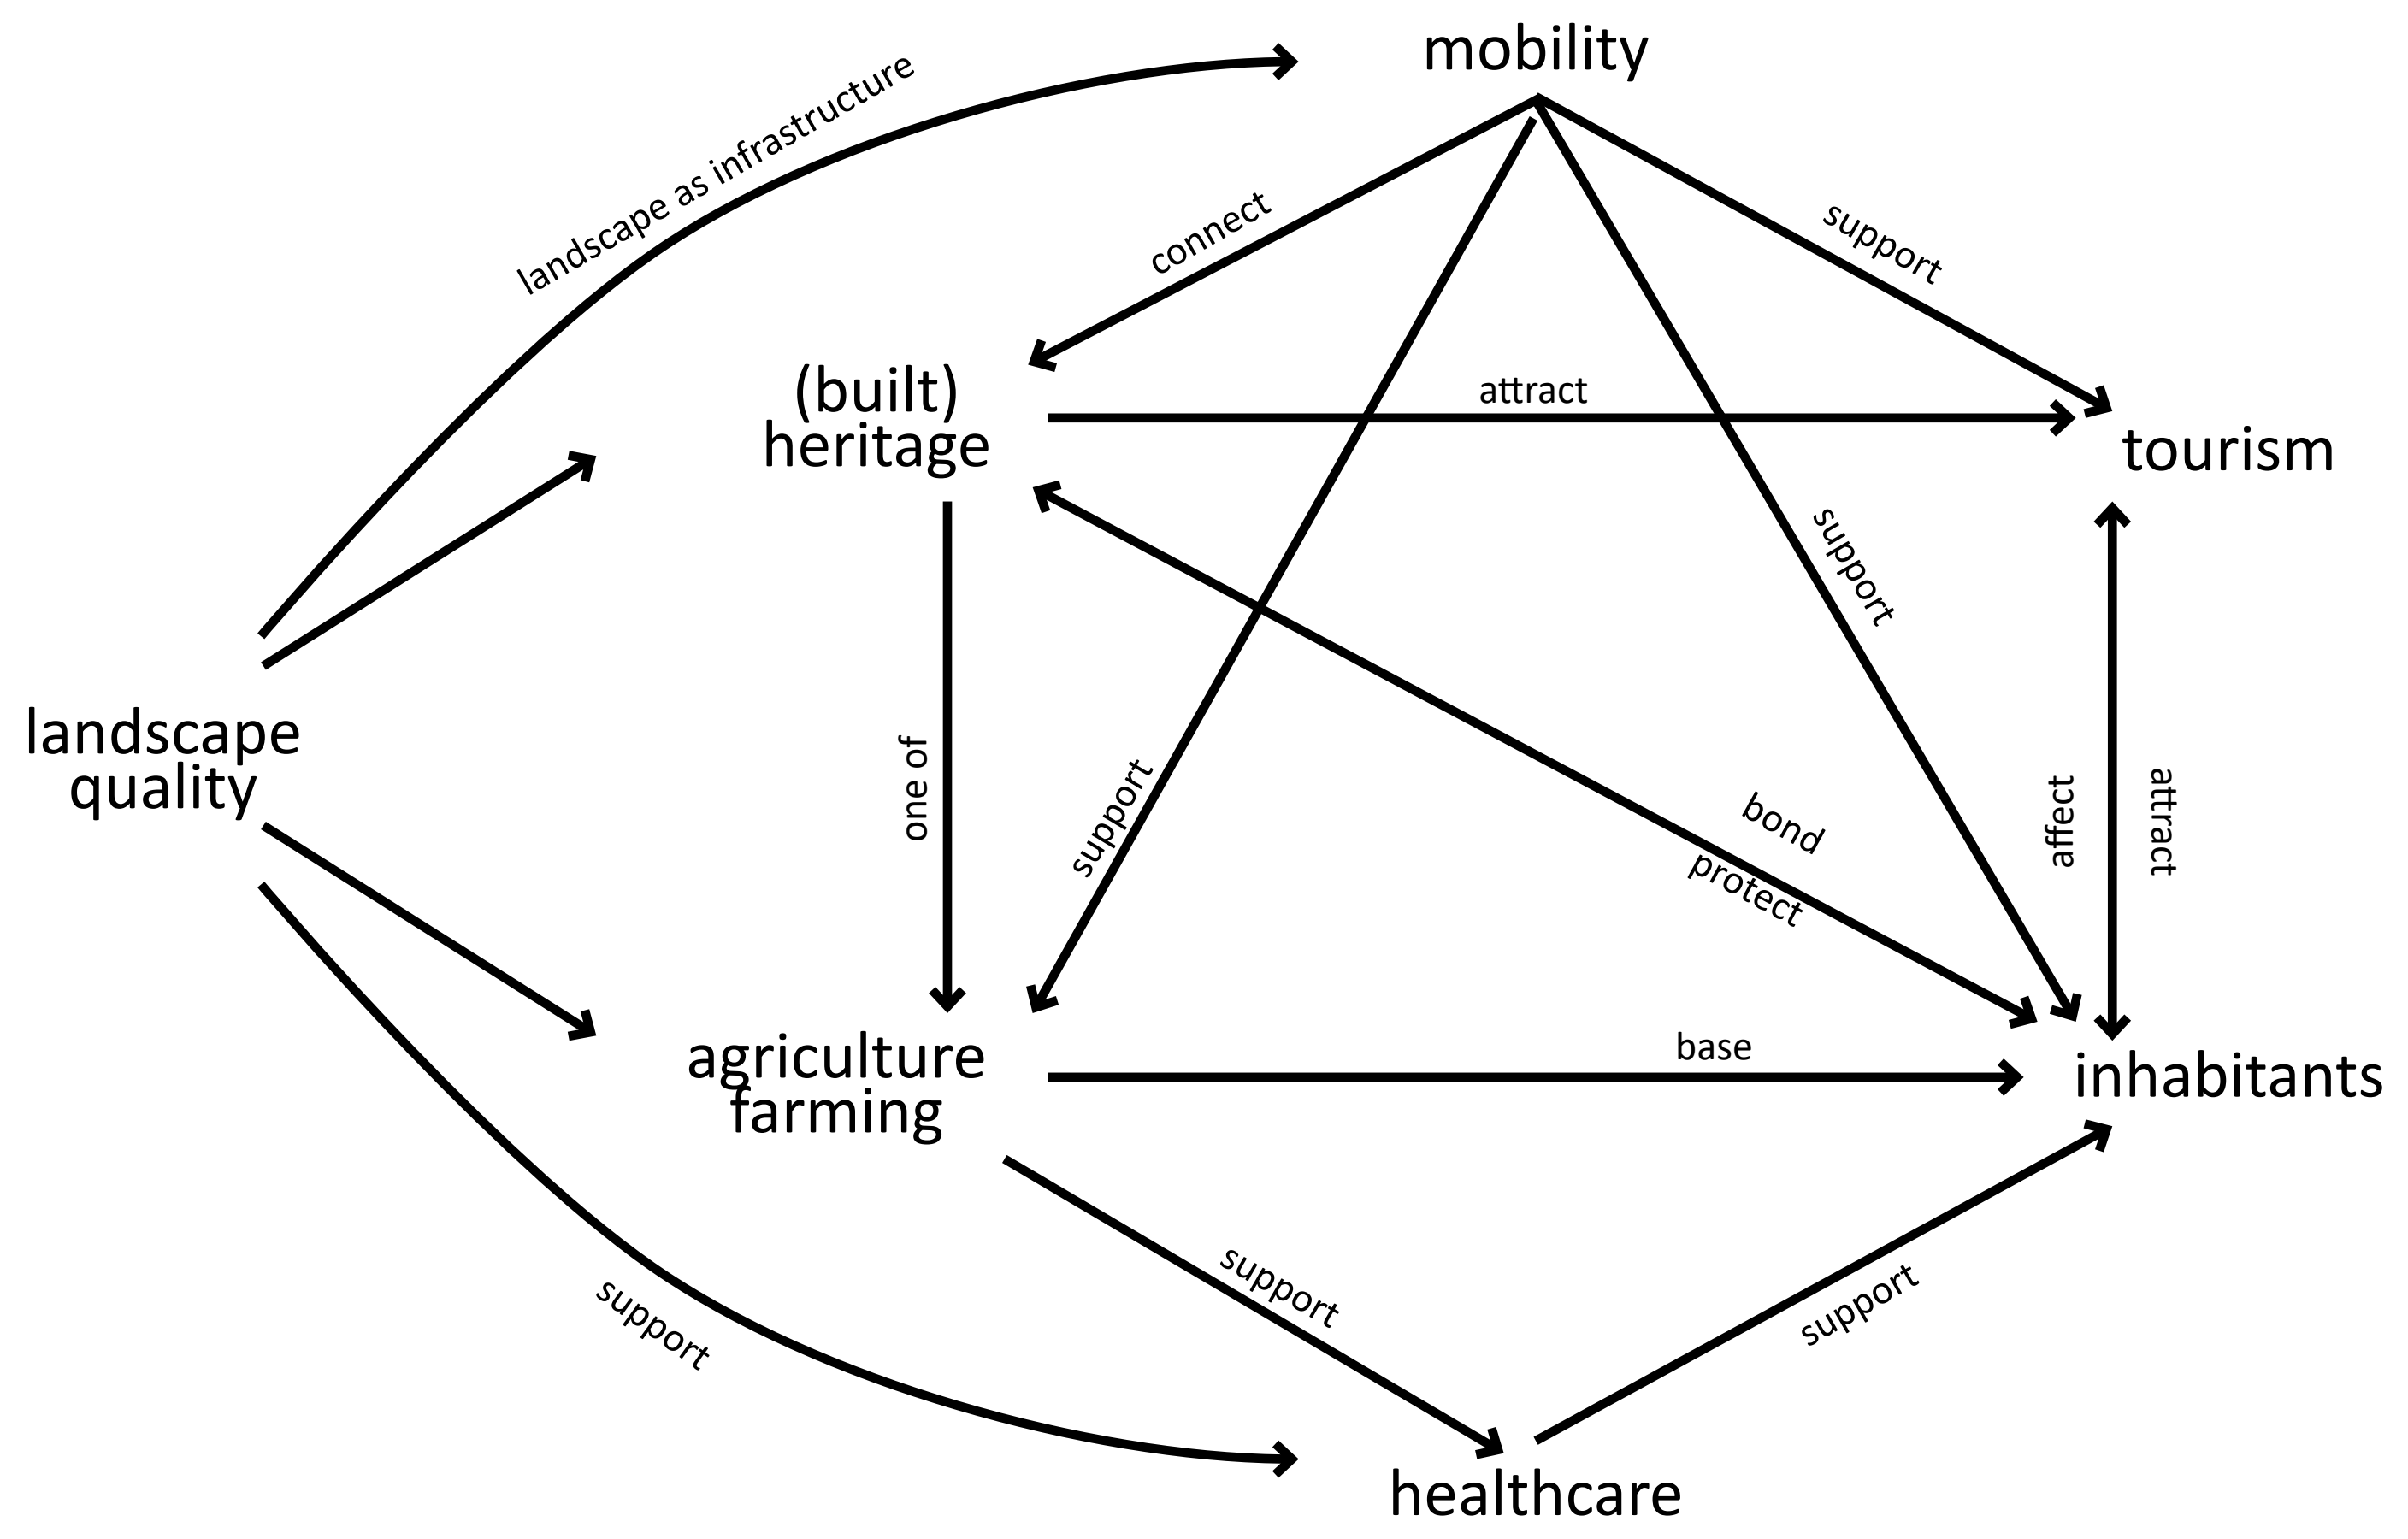

green care farms in Parkstad and Maastricht

scope - tourism and mobility

principles

long-term management

development phases instead of blueprint

interactive landscape

stimulating and engaging activities for elderly;
public open space for the community and the tourists

mobility

easy access to all kinds of facilities and being free to move around;
effective combination of fast-speed and low-speed transportation

edge clearance & transition

strengthen the green edge of settlement and topography;
clarify the transition between urban and rural area

interpretation

better definition of landscape and people's understanding of
it to create a stronger shared sense of place

collaboration

joint force among all related parties

Strategy

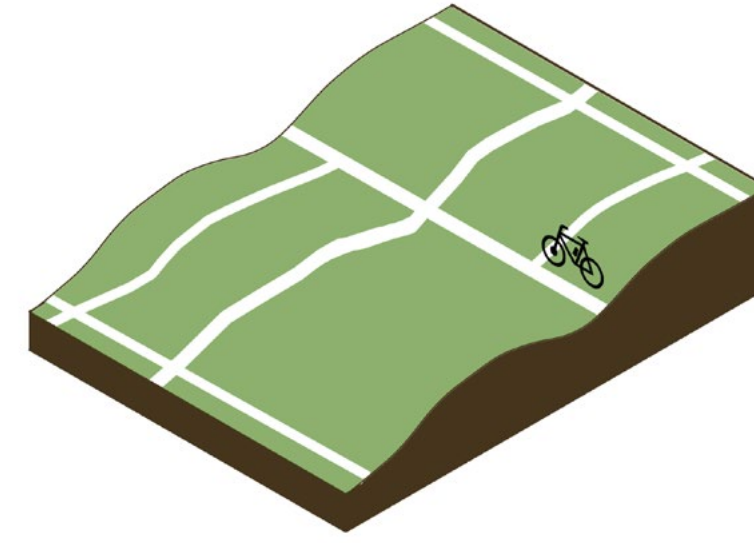

wooded steep slope

- protect against erosion and flood
- create habitat & ecological connection
- strengthen the contrast between open plateau and valley

high stem orchard as transfer

- create habitat & ecological connection
- revive traditional agricultural landscape

cycling routes cutting contour

- enrich the experience of hilly cycling

waterfront path

- invite people to take a walk near the brook, enjoy scenery, and even raise awareness about climate change and environmental protection

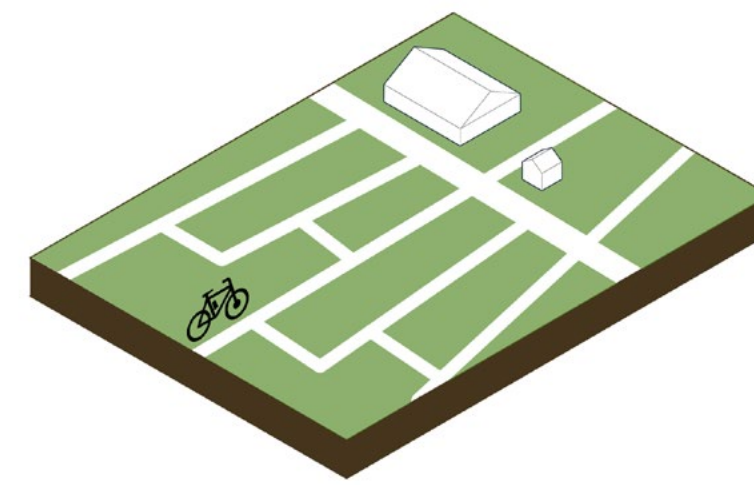

greenery on the edge

- emphasize the framing of the village
- emphasize the typical hollow roads
- serve as green chain connecting settlement and rural nature

ragged plot as transfer

- create habitat & ecological connection between settlement and forest

green cycling routes

- easy access from settlement to rural nature
- enrich the experience among different greenery

brook in woods

- maintain the wild natural habitat for biodiversity
- enhance the enclosed and dense spatial quality

stimulating activities

open outdoor space with interactive elements and activities like stables, gardens, animals, to stimulate elderlys being physically and sensory active

A traditional high-stemmed orchard in Limburg keeps livestock apart from the fruit trees, such as sheep and cows. They pasture in the orchard to maintain the ground floor grass, and their waste is organic fertilizer directly for the fruit trees.

robin

Bird houses welcome small birds and fowls which can help deal with pests on the trees to replace pesticides and to reduce chemical residue.

pests

Honey is harvested from the beehives built for bees. They help trees and other plants on the farm to pollinate. Beehives even can help increase the number of wild bees which are experiencing sharp depopulation in recent years.

beehives

bird house

Little owls feed on voles that often destroy fruit trees roots.

vole

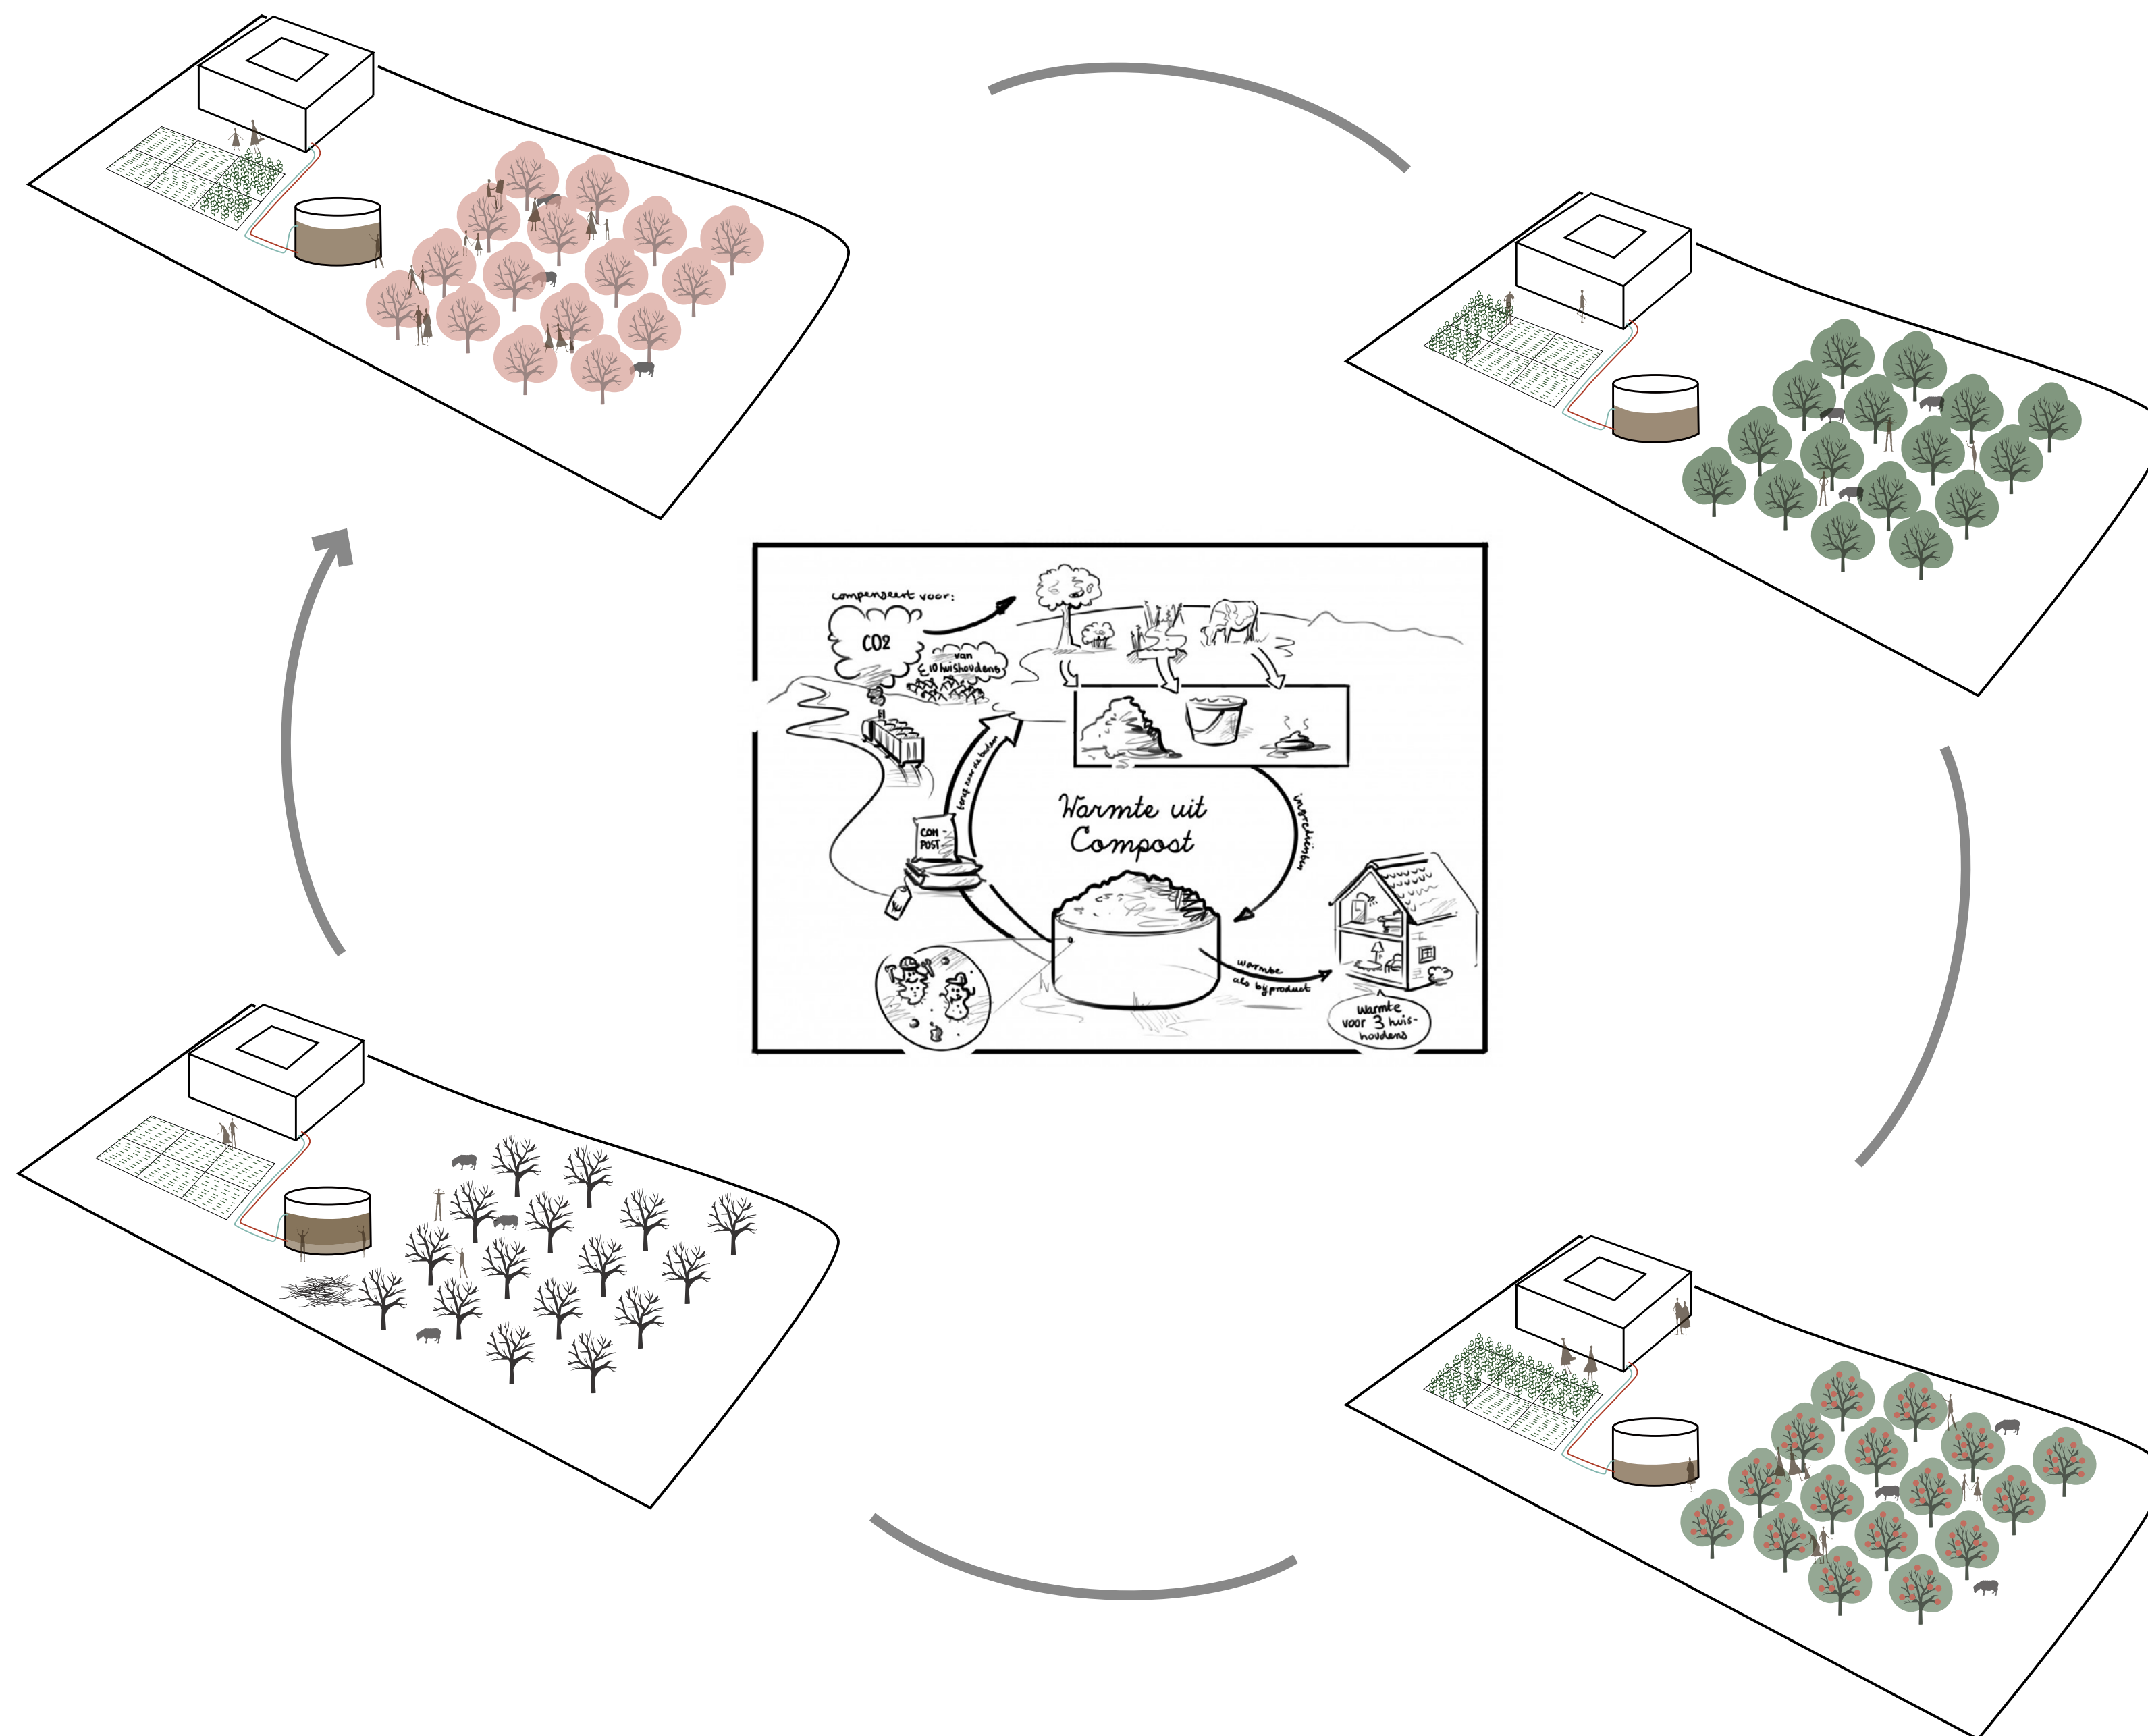

self-sustainability

A biomeiler can be self-installed on the farm. Using sheep manure, wood chips and some water, it can provide heat and energy for the hoeve and harvest compost, achieving a closed energy flow on the farm.

self-sustainability

A biomeiler can be self-installed on the farm. Using sheep manure, wood chips and some water, it can provide heat and energy for the hoeve and harvest compost, achieving a closed energy flow on the farm.

convenient mobility

by creating different biotopes, historical dirt roads can provide diversified environmental experiences as well as guarantee convenient mobility

convenient mobility

by creating different biotopes, historical dirt roads can provide diversified environmental experiences as well as guarantee convenient mobility

convenient mobility

easy access to all facilities and being free to move around within the green care farm; safe pedestrian routes within the neighborhood

Regional scale - analysis

Regional scale - analysis

Regional scale - strategy

400 meters range of bus station
Bus transportation mostly covers rural agglomerations, while small and separate villages are not easily accessible by bus.

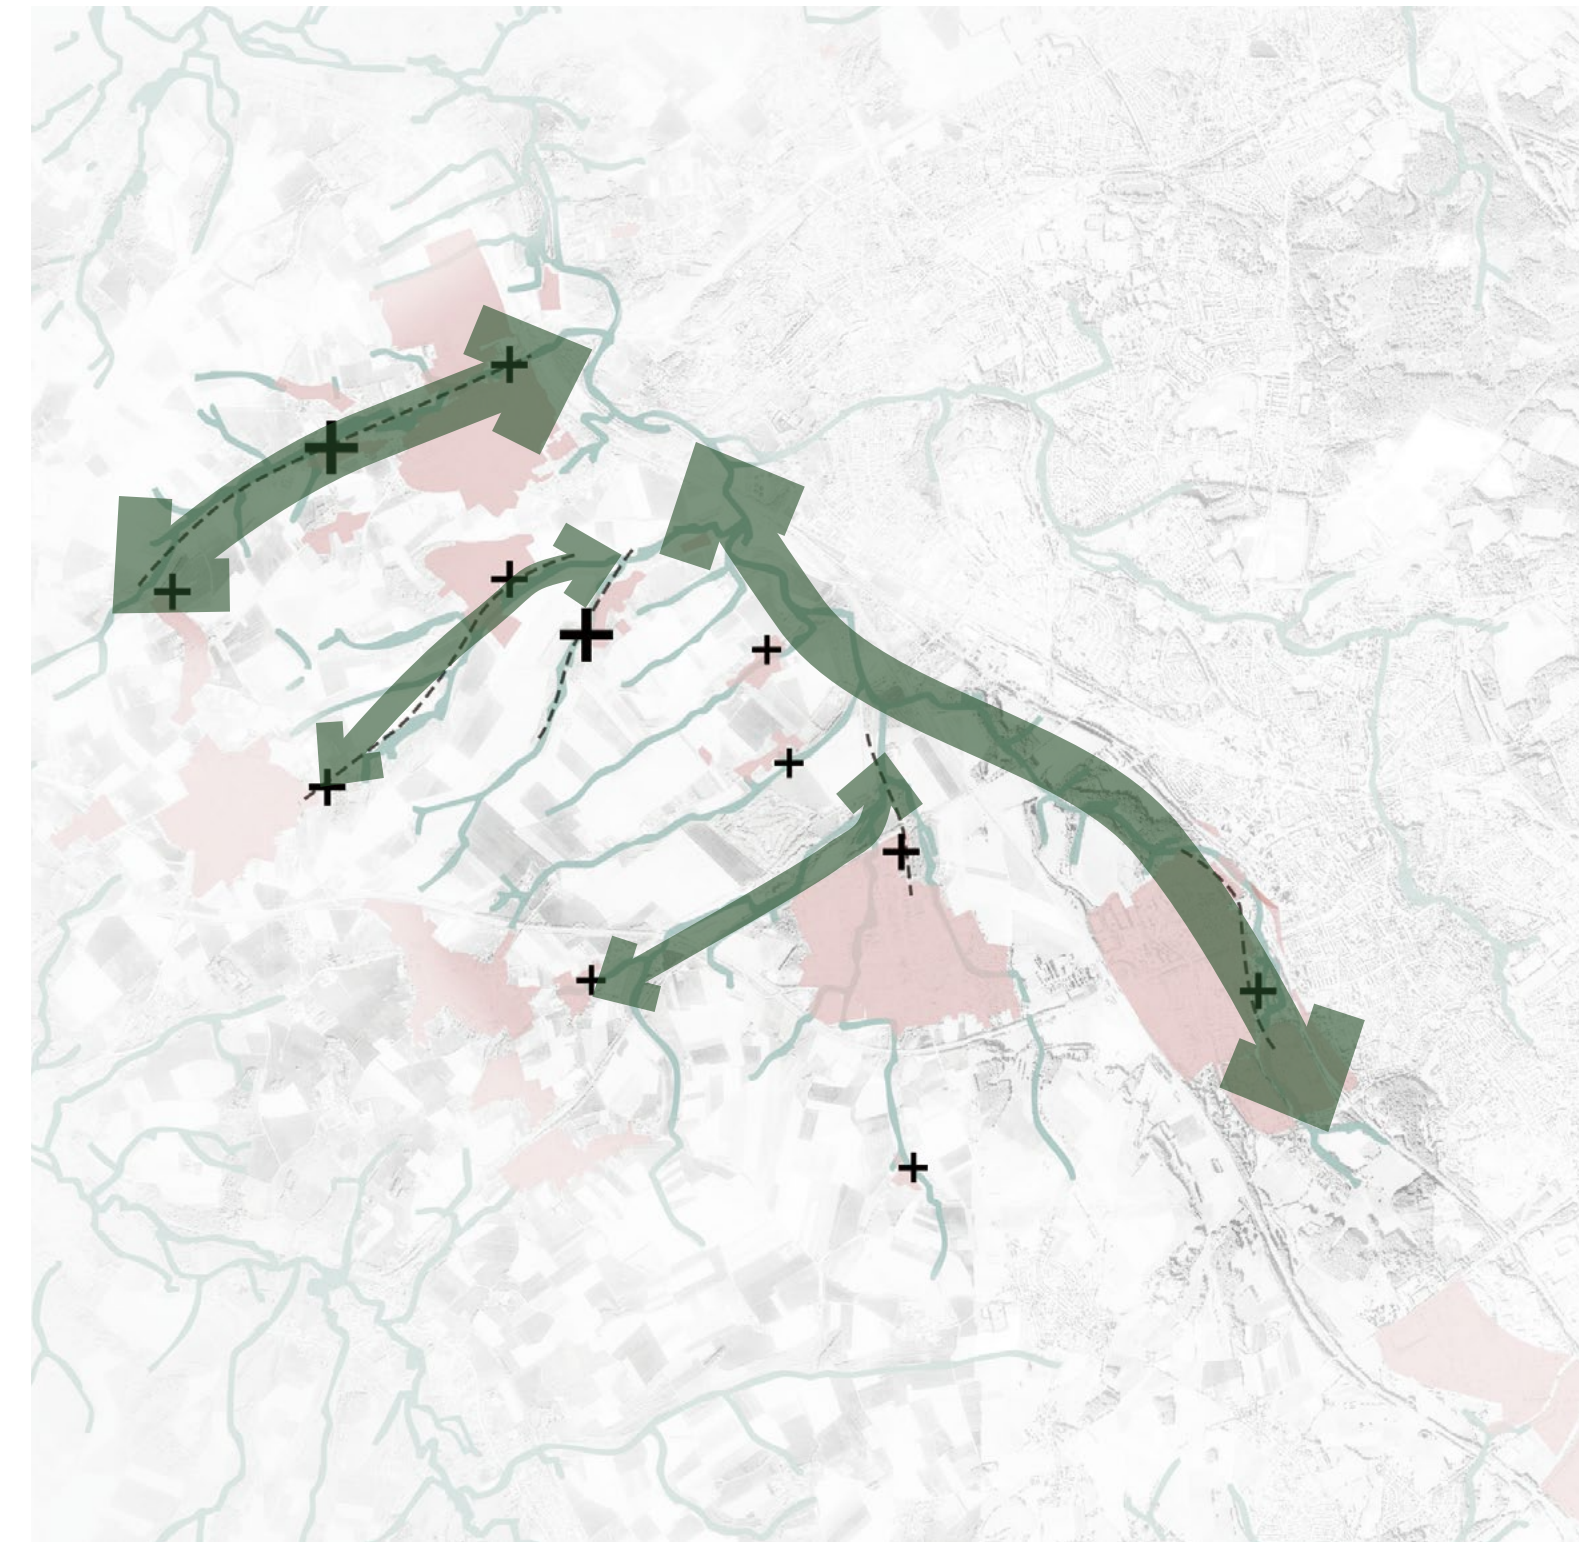

Adding parking spots and charging spots for e-bikes at road nodes to improve multi-speed transportation systems for a better mobility and accessibility in the region.

Regional scale - strategy

Desiccation sensitivity
well developed vegetation area and poorly developed are mixed. The less developed areas can be improved with help of well developed ones.

Focusing on the green edge, particularly the edge with historical ribbon villages; and strengthening landscape character and spatial structure.

Regional scale - strategy

High accumulation of elderly people is mainly in urban area. The percentage difference among different communities is smaller in rural than in urban.

Looking for potential outdoor public space in a community, not only for the elderly, but for the expanding neighborhood in the future as well.
