High-Tech Origins

Buckminster Fuller – Tensegrity model

“I am a passenger on spaceship earth” –
Buckminster Fuller

Frei Otto – Munich Olympic Stadium

High-Tech

Norman Foster – HSBC, Hong Kong - 1985

Norman Foster Commerzbank, Frankfurt - 1994

Richard Rogers – Lloyds of London - 1986

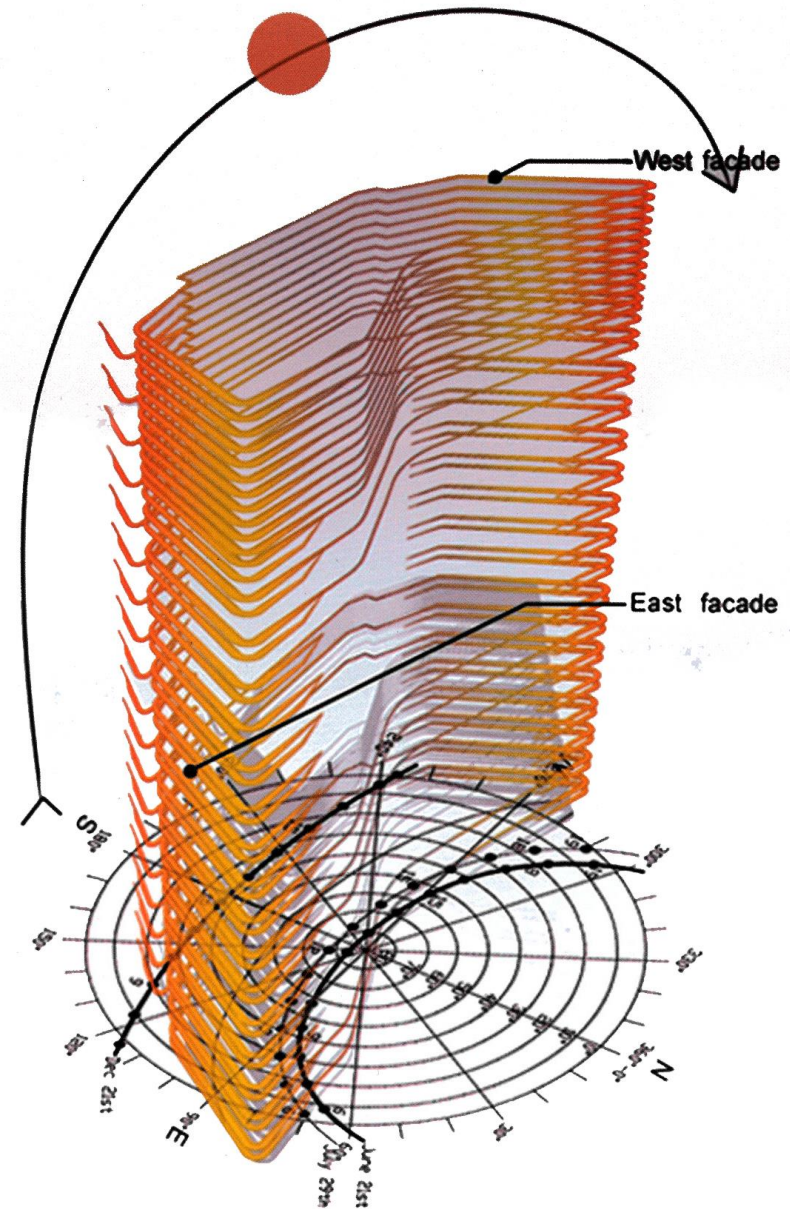

Mark Lascelles Thornton, "The Happiness Machine"

Locality in Design

“Ecological design is not just about low-energy systems; to be fully effective, these technologies need to be thoroughly integrated into the building fabric; they will also be influenced by the physical and climatic conditions of the site. The nature of the problem is, therefore, site-specific...”

- Ken Yeang

Early stage design

- Available data for assisted workflow
- Available data for traditional workflow
- Impact of decisions made

Problem Statement

***Sustainable High-Rises** should be designed contemplating locality in design during **early concept stage** of the design process. **Computational simulations** and optimization can help the designer to identify promising design solutions, **however**, existing simulations are **computationally expensive** and thus cumbersome during this initial stage, therefore designers rarely design with enough contextual information.*

Type	1	Daylight	Description	Limitations / Comments	Climate Type	Example	Pg
Use	1.1	Solar Access	Public places designated to have full sunshine "sun Spots" during their most intensive use or high frequency periods	Requires proactive rather than reactive city planning.	Temperate	Rotterdam City Planning	99
Use	1.2a	Solar Orientation	Orientation of the tower specific to the sun path of tropical climate	building cores are placed on the hot east and west facades	Tropical	IBM Plaza - Kuala Lumpur	170
Use	1.2b	Solar Orientation	Same principles, temperate climate - Maximize solar gain into interior spaces in winter and maximize solar shading in summer	Peripheral apartments enclose an internal atrium	Temperate	Bishopsgate Tower - London	174
Use	1.3	Diagonal Lightshaft	Atrium and Diagonal lightshaft - diagonal opening through the section of the building	Allows for more natural sunlight to enter deepest sections of the building	Tropical	Solaris Fusionopolis - Singapore	182
Use	1.4	Ecocells	Sun wells that allow daylight to penetrate into the basement levels	Allows for natural sunlight and ventilation	Tropical	Spire Edge - India Manesar	180
Use	1.5	Horizontal Louvers	The size and depth of the louvers was determined by the sunpath	Louvers also serve as light shelves	Tropical	Spire Edge - India Manesar	180

Type	2	Facade Tech	Description	Limitations / Comments	Climate Type	Example	Pg
Prod	2.1	PV Panels on facades	Vertical surface solar energy generation - The farther north / south hemispheres, the more productive the facade can be	Amsterdam: Average maximal Solar angle of 37 (more vertical than horizontal)	Temperate	Amsterdam	
Prod	2.2	Solar Collectors	Use of limited roof space for parabolic solar collectors	Although High-rises do not have extensive roof space	Temperate	Villa Flora	139
Use	2.3	Louvered Facades	Louvered panels protect the facade from solar gain	Design determined by orientation	Tropical	Menara Mesiniaga	171
Use	2.4	Balconies	Deeply recessed balconies and planter boxes	Provide sunshading	Tropical	Central Plaza Tower	172
Use	2.5	Recessed Windows	Deeply recessed windows	Solar heat gain protection	Tropical	Menara Umno Penang	172
Use	2.6	Buffer Cores	Cores serve as thermal buffers	Located in zones with highest solar heat gain	Tropical	Singapore National Library	176
Use	2.7	Glazing	Low-E	low external thermal transfer value (ETT) - 39 watts /m2	Tropical	Solaris Fusionopolis - Singapore	184
			Double glazing		Gen	General	
			Double glazing Argon-filled cavities		Gen	General	
			Triple Glazing		Gen	General	

Type	3	Vitality / Social	Description	Limitations / Comments	Climate Type	Example	Pg
			State of stasis, the built environment that imitates an ecosystem that recycles and reuses byproducts to produce zero waste	Is not the result of adding more and more technological gadgetry	Gen	General	168
Use	3.1	Ecomimesis	Sky Courts / Gardens	Spiraling green garden connected to the surrounding landscape and sky courts and sky gardens	Tropical	Menara Mesiniaga	171
Use	3.2	Vertical spatial continuity	Continuous landscaped ramp through the tower	Spacial continuity between street and the tower	Tropical	EDITT Tower - Singapore	173
Use	3.4	Comunal Skycourt	Sky gardens every 5th level to provide landscaped communal sky courts		Tropical	Bombay Glassworks tower - Mumbai	185

Type	4	Green / Water	Description	Limitations / Comments	Climate Type	Example	Pg
Use	4.1	Vertical Green landscapes	Provides shading, evaporative cooling and micro-climate improvements	High maintenance of Vegetation	Tropical	EDITT Tower - Singapore	173
Prod	4.2	Vertical Greenhouse	Vertical glazed greenhouse could be used for agriculture	Cannot yield as much as commercial farming, but provide locally grown fruit, vegetable, herbs and spice	Temperate	Villa Flora / Harvest Tower	140
Prod	4.3	Rainwater reuse	Rain water catchment, retention, storage and recycling		Tropical	Spire Edge - India Manesar	180
Use	4.4	Efficient Water Fixtures	low-flow rate fixtures and gray water flushing		Temperate	Leza Soho - Hangzhou, China	

Type	5	Wind	Description	Limitations / Comments	Climate Type	Example	Pg
			General Shape & Texture	Iso Standard - wind study to measure effects of building shape, texture and facade during preliminary design stage		Generic	
Use	5.1	Aerodynamic Shape	Structure that promotes air acceleration through building, thus cooling interior by few degrees	Requires existing context, can change with future proposals	Tropical	Singapore National Library	
Use	5.2	Aerodynamic Shape	Oval Shape	Reduces stress on superstructure generated by wind loads	Tropical	EDITT Tower - Singapore	174
Prod	5.3	Wind Turbines	Turbines in facade on rooftop level		Tropical	Miami COR building	
Use	5.4	Wind wing Wall	A 21 story high vertical project wall directed towards the prevailing wind	Creates positive and negative pressure zones that are very effective in providing natural ventilation through the common areas	Tropical	Menara Umno Penang	172

Type	6	Natural Ventilation	Description	Limitations / Comments	Climate Type	Example	Pg
Use	6.1	External Atrium	External atrium	Creates a wind shaft to cool the offices facing the atrium	Tropical	Kuala Lumpur Tower - Plaza Atrium	170
Use	6.2	Central Atrium	Central atrium open at the base	Creates a cool microclimate while allowing natural daylight to reach the circulation areas within the building	Tropical	Library of Singapore	176
Use	6.3	Vertical Atria Gardens	Vertical atria gardens / airwells and public spaces	Provide passive cooling	Dry	Ecobay Complex - Abu Dhabi	178
Use	6.4	Service Core Placement	Service core located on the hot side of the building	Naturally ventilated to reduce the air conditioning load on the offices	Tropical	Menara Boustead - Kuala Lumpur	171
Use	6.5	Cooridors	Naturally ventilated single-loaded corridors face the hot wester side of the site	Act as buffer, reducing insulation	Tropical	Casa del Sol - Kuala Lumpur	172

Use Effective Usage
Prod Production

Objectives:

- - Energy Consumption
- = Natural Daylight
- + Thermal Comfort

Surrogate Modeling

Promising Results of up to 80% time reduction

Feed candidates from simulations, the more evaluations the more precise the surrogate will be

Can provide good solutions and contribute the designer for better understanding of the design problems

(Westermann & Evins, 2019)

Research Question

How can a computational method using surrogate modeling be used to quickly identify, and optimize the most influential factors and their combinations for context-based passive solutions of sustainable High-Rise office buildings during their initial design phase?

Sub questions

- How do different location/climates dictate the building's ideal **shape and orientation**?
- How does the general volumetric **context** of surrounding buildings affect its **shape and façade parameters**?
- How does position of its **Core** affect a building's energy performance in relation to its **location/climate**?
- What is the **pareto-optimality** of these parameters when simultaneously seeking energy consumption, thermal comfort and natural daylight optimums?
- What are the key **validation metrics** and features necessary for obtaining suitable **surrogate models**.

Energy Consumption

$$-/+Q_{\text{transmission}} -/+ Q_{\text{ventilation}} - Q_{\text{infiltration}} + Q_{\text{sun}} + Q_{\text{internal}} - Q_{\text{energyuse}} = 0$$

$$Q_t + Q_v + Q_i + Q_{\text{sun}} + Q_{\text{int}} = -Q_{\text{energyuse}}$$

$$Q_t = \sum U * A * (T_e - T_i)$$

U = U-value
 A = area of the
 façade

T_e = temperature
 outside (climate
 dependent)

T_i = temperature
 inside
 (comfort dependent)

$$Q_v = V_{\text{vent}} * \rho * C_p * (T_e - T_i)$$

V_{vent} = Ventilation
 flow
 ρ = air density = 1.2
 C_p = air heat
 capacity

T_e = temperature
 outside (climate
 dependent)

T_i = temperature
 inside

$$Q_i = V_i * \rho * C_p * (T_e - T_i)$$

V_i = infiltration flow
 (0.2)
 ρ = air density = 1.2
 C_p = air heat
 capacity

T_e = temperature
 outside (climate
 dependent)

T_i = temperature
 inside
 (comfort

$$Q_{\text{sun}} = A_{\text{glass}} * q_{\text{sun}} * g$$

A_{glass} = glazing area
 g = g-value

q_{sun} = Radiation on
 glass (climate
 dependent)

$$Q_{\text{int}} =$$

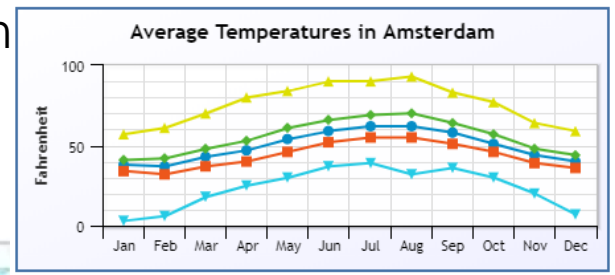

$Q_{\text{people}} +$
 $Q_{\text{light}} +$

0. Parameters – Orientation

The image displays a dual-pane interface. The left pane shows Rhino 6 Educational (182 Days Remaining) in Perspective view, featuring a 3D model of a building with a grid and a central structure. The right pane shows the Grasshopper - Test25(P3)* window with a script for controlling orientation.

Grasshopper Script Details:

- Input:** A list of four integers: 0, 3, 1, 4, 2, 8, 3, 32.
- Process:** The list is processed by a 'List' component with 'Index' and 'Wrap' options. A 'Shape' slider is set to 1.
- Output:** The script outputs a list of file paths for four locations:
 - 0 R:\ffortich\ladybug\EPW_Thesis\Amsterdam\NLD_Amsterdam.062400_IWEC.epw
 - 1 R:\ffortich\ladybug\EPW_Thesis\Bogota\COL_CUN_Bogota-Eldorado.Intl.AP.802220_TMYx.2003-2017.epw
 - 2 R:\ffortich\ladybug\EPW_Thesis\Dubai\ARE_DU_Dubai.Intl.AP.411940_TMYx.2003-2017.epw
 - 3 R:\ffortich\ladybug\EPW_Thesis\Shenzen\CHN_Guangdong.Shenzen.594930_SWERA.epw
- Orientation Control:** A 'Geographic_Location' slider is set to 0, which is connected to a 'Number Slider (Orientation)' component. The slider's settings are: Integer accuracy, Lower limit: 0, Upper limit: 7, Value: 0, Factor: 0%.

The bottom status bar indicates: Solution completed in ~6.6 seconds (17 seconds ago). The Windows taskbar shows the time as 10:40 PM on 4/2/2020.

0. Parameters – Core & Orientation

The image displays two software windows side-by-side. The left window is Rhino 6 Educational, showing a 3D perspective view of a building model with a central core and surrounding blocks. The right window is Grasshopper, showing a parametric script for the building model. The script includes a 'Glazing Ratio' component with several sliders and a 'Number Slider (Core_Type)' component.

0. Parameters – Shape

The image displays a dual-pane interface. The left pane shows Rhino 6 Educational in Perspective view, featuring a 3D architectural model of a building with a grid overlay. The right pane shows the Grasshopper interface for a file named 'Test25(P3)*'. The Grasshopper interface includes a toolbar with categories like Geometry, Primitive, Input, and Util. The main workspace contains a script with the following components:

- Two sliders: SHGC (0.6) and VLT (0.6).
- A list component containing a list of file paths:

```
{0}
0 3
1 4
2 8
3 32
```
- A 'Shape' slider set to 0.
- A 'List Index' component with 'Wrap' checked.
- A 'Number Slider (Shape)' component with the following properties:
 - Numeric slider for single values
 - Integer accuracy
 - Lower limit: 0
 - Upper limit: 3
 - Value: 0
 - Factor: 0%
- An 'Orientation' slider set to 0.

The bottom status bar of the Grasshopper window indicates 'Solution completed in ~5.7 seconds (4 seconds ago)'. The Windows taskbar at the bottom shows the time as 10:19 PM on 4/2/2020.

0. Parameters – Floor Heights / Total Height

The image displays a dual-pane interface. The left pane shows Rhino 6 Educational (182 Days Remaining) in Perspective view, featuring a 3D model of a building with a grid of floor heights. The right pane shows the Grasshopper - Test25(P3) window with a script containing several sliders and a Number Slider component.

Energy efficiency of design options: ■ <1% (remarkable energy saving); ■ 1-5% (average energy saving); ■ 5-10% (low energy saving); ■ >10% (not recommended). A: High space efficiency; B: Aerodynamic form; C: Narrow plan (NV & daylight access); D: Less material use for external envelope; MD: Maximum deviation; N: North orientation; E: East orientation; S: South orientation; W: West orientation.

Surrogate Models

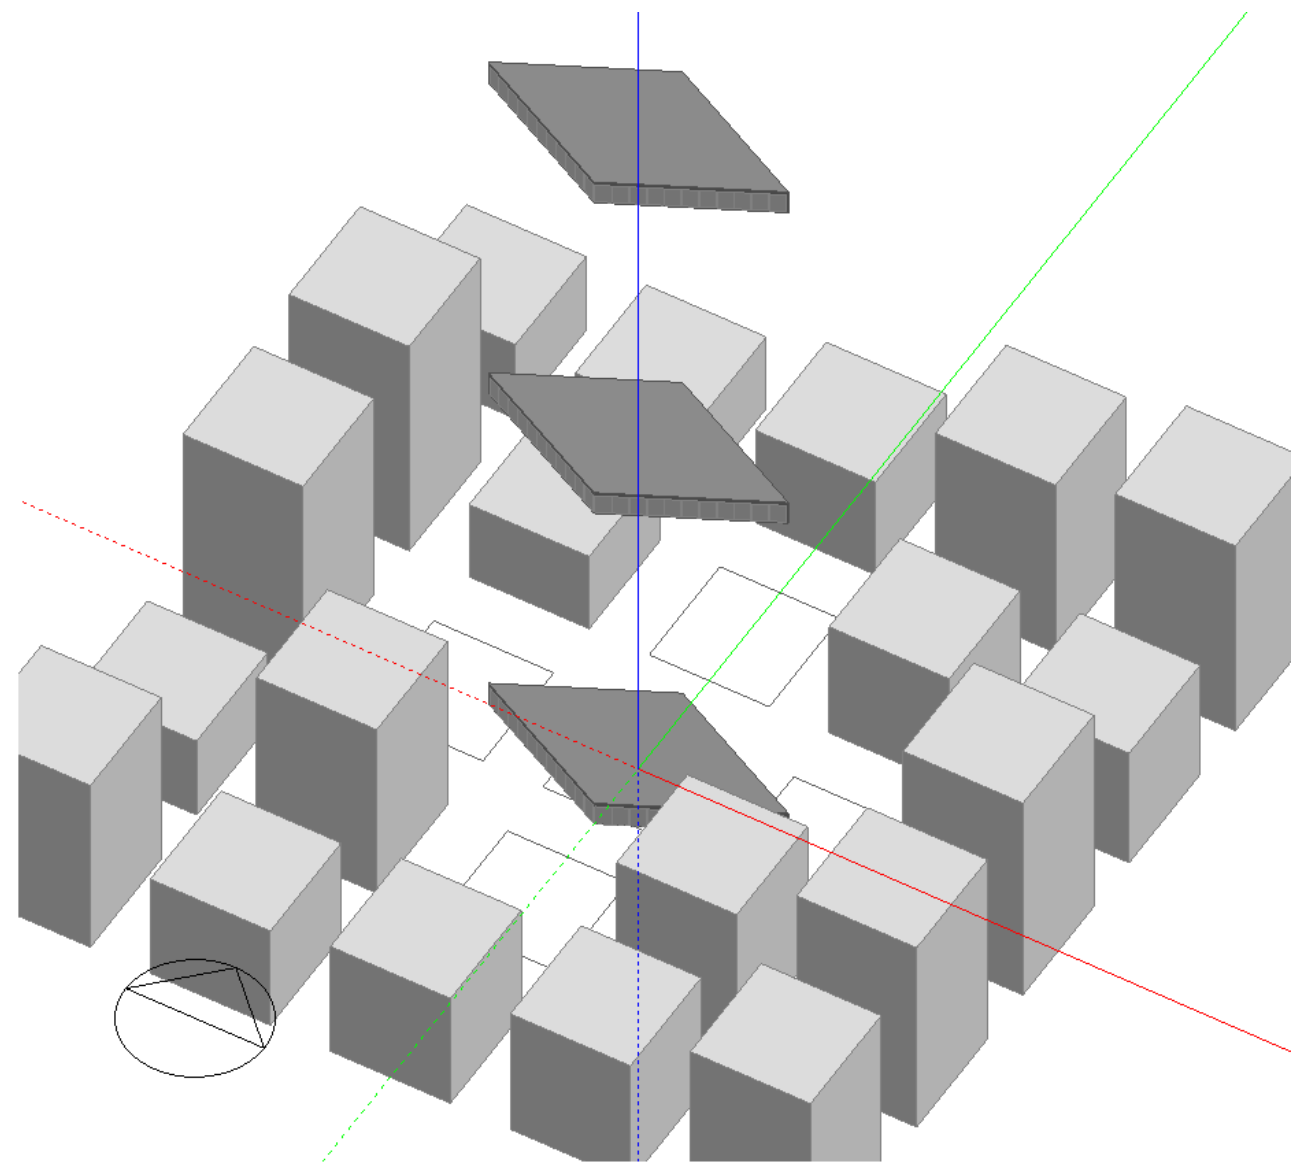

Workflow

1. Validation in Design Builder

Grasshopper – HoneyBee / LadyBug - EnergyPlus

Design Builder – EnergyPlus

5. Optimization – Single Objective Optimization

The screenshot displays a Grasshopper script with several components and a C# script editor. The components and their outputs are:

- Floor_Area**: Output 0 73.517462
- EUI (kWh/m2)**: Output 0 73.517462
- % Time Comfortable**: Output 0 61.867455
- UDI**: Output 0 48.044633
- Highest UDI**: Output 0 48.044633

The C# script in the background defines a class `Script_Instance` with a `RunScript` method. The method calculates a weighted objective function `A` based on constraints for Floor Area (FA), EUI, COM, and UDI:

```
private void RunScript(double FA, double EUI, double COM, double UDI, ref object A)
{
    if ( FA < 500 || FA > 2000 || COM < 60 || UDI < 50)
    {
        A = FA * EUI * COM * UDI;
    }
    else
    {
        A = EUI;
    }
}
```

Energy:

-Lower EUI (kWh / m2 * yr)

Comfort:

+At least 60% of the time>

Daylight

+Higher UDI (100-2000 lux)
50% of the time

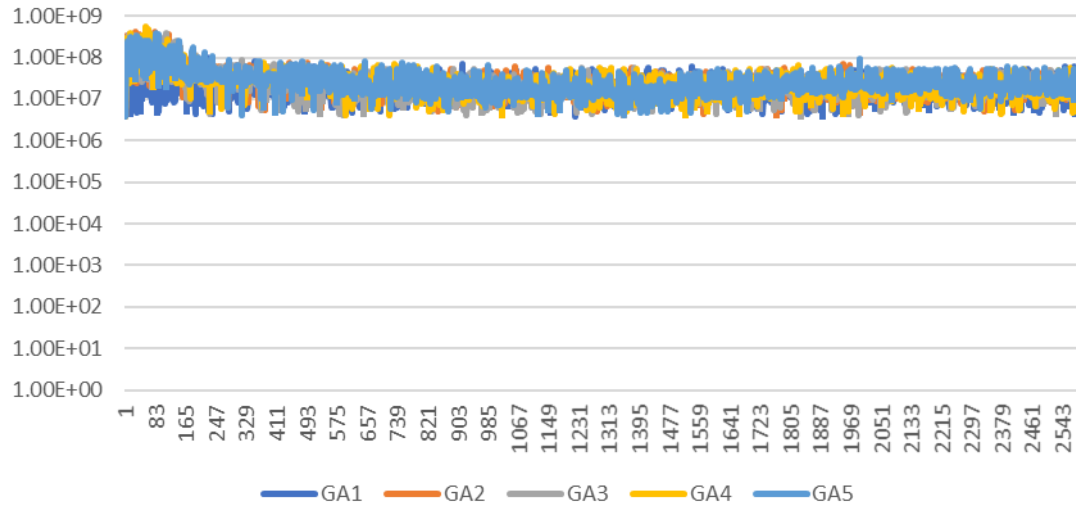

Area

Boundary:

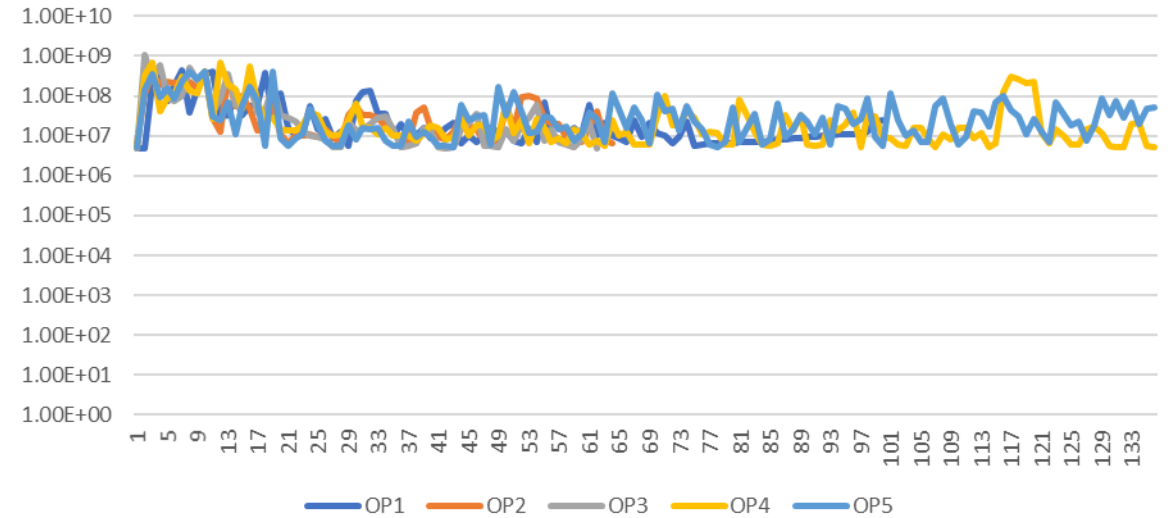

<500 and 2000 m²>

5. Multi-Objective Optimization - Octopus SPEA 2

Energy:

-Lower EUI (kWh / m² * yr)

Comfort:

+At least 60% of the time>

Daylight

+Higher UDI (100-2000 lux)
50% of the time

Area

Boundary:

<500 and 2000 m²>

5. Multi-Objective Optimization - Octopus SPEA 2

Proposal

Sunpath

Conclusions

Building Physics:

- Shape Parameters more significant than Envelope Parameters
- Different responses per level and orientation
- Location plays a significant role thus independent models
- Analysis level (context) not as significant in global outputs

Computational:

- High Learning Curve
- Once created, much faster for exploration and optimization
- The more variables & Samples, the more worth it
- A Tool, not a Replacement of human creativity
- Eliminate human bias
- Chosen solution should be double checked with another simulation

Surrogate Model Live

- From 500 simulated samples in 8820 minutes (100%)
- Down to 500 samples in 250 minutes (2.8%)
(Visualization / Form Generation turned on)
- Down to 500 samples in 189 seconds (0.036%)
(Visualization / Form Generation turned off)
- 99.96% reduction of the computational load.
