# Motivation

- 1 This is a Hi-CLIMB S-velocity tomography by *Xu et al. 2013*
- 2 Objective: improve the depth resolution of S-velocity structure
- 3 Delineate Moho depth and low velocity zones

# From high to low wavenumbers

- 1 Local crustal earthquakes provide high frequencies and illuminate structure with high wavenumbers
- 2 Scattered coda wave field provides broader spectrum of wavenumbers
- 3 Coda are generally too complex for tomographic inversion
- 4 Cross-correlation interferometry can transform these complex coda into virtual shot gather
- 5 Location and timing of a virtual source is exact

# From high to low wavenumbers

- ⑤ Location and timing of a virtual source is exact

# Simulation

- 1 2D scalar finite difference simulation with S-wave velocities
- 2 Model based on S-wave tomography (*Xu et al. 2009*)
- 3 Test retrievability of Moho reflection with sparse crustal source distribution
- 4 Do crustal heterogeneities improve the retrieval of the Moho reflection?

# Simulation

- 3 Test retrievability of Moho reflection with sparse crustal source distribution
- 4 **Do crustal heterogeneities improve the retrieval of the Moho reflection?**

## Processing flow

- Input: particle velocity recordings of 20 monopole simulations
- Remove the direct wave of each dataset
- Apply exponential gain function to the coda
- Cross-correlate traces of all possible receiver pairs
- Sum the 20 correlation gathers
- Exponential gain applied to final result

# Moho model

- Moho depth and S-wave velocities from Tibetan Plateau (*Xu et al. 2009*)
- 100 km long array with 0.4 km spacing (green)
- 20 crustal sources far offset from middle (red)
- Ricker wavelet with bandwidth 0.5-3 Hz

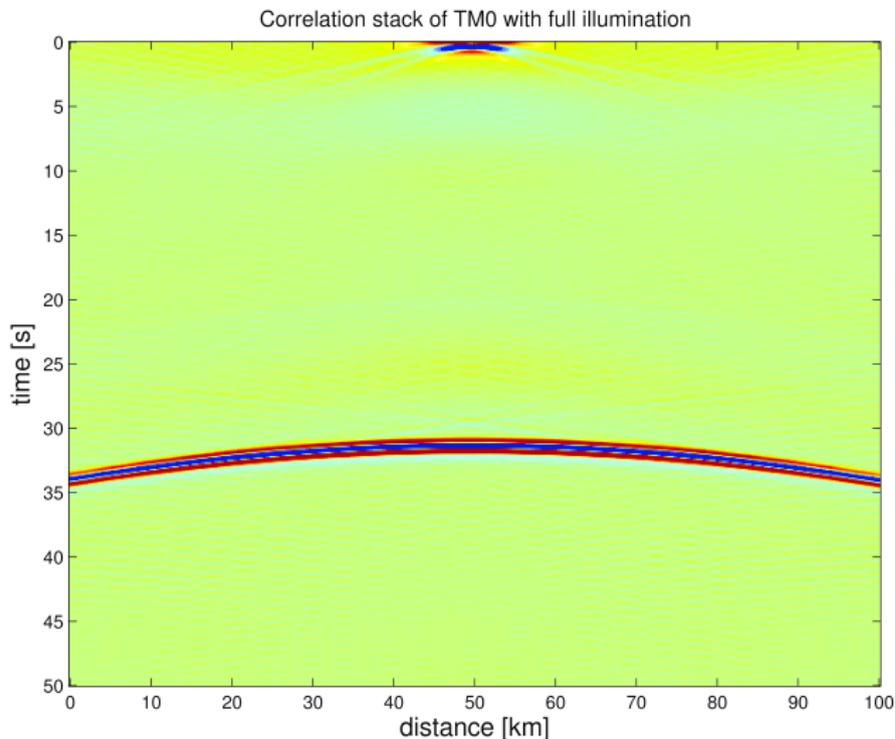

# Moho model

- Active source at the center

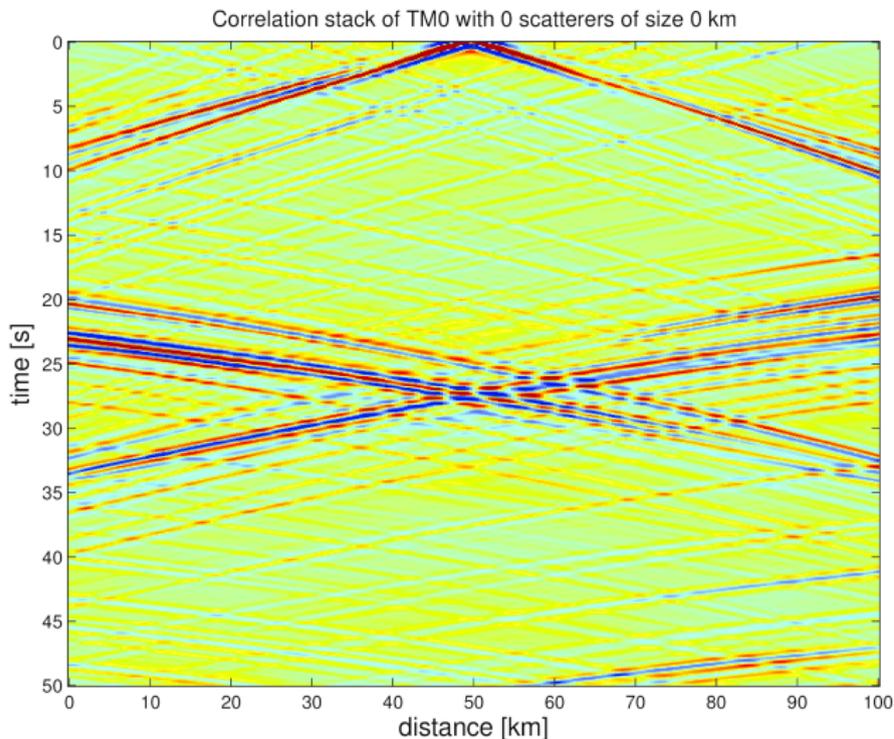

# Moho model

- Cross-correlation retrieval for optimal illumination conditions

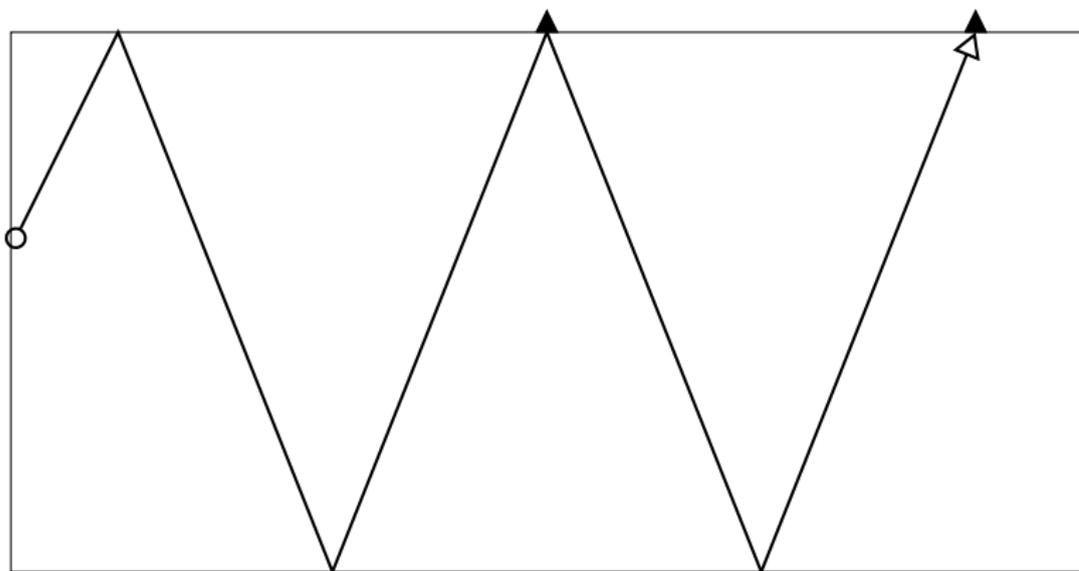

# Moho model

- Cross-correlogram with virtual source at the center

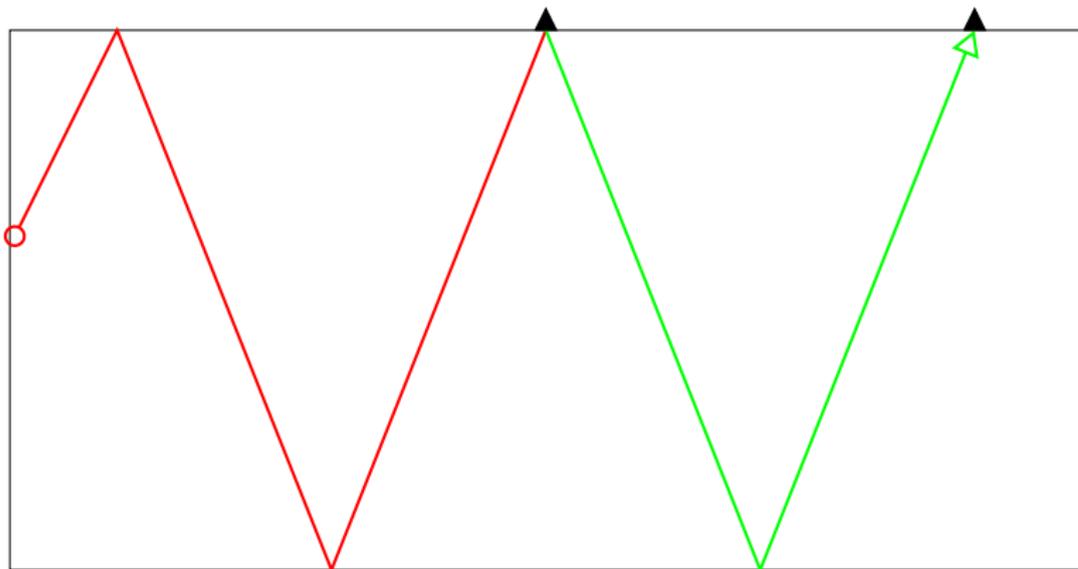

## Ray diagram

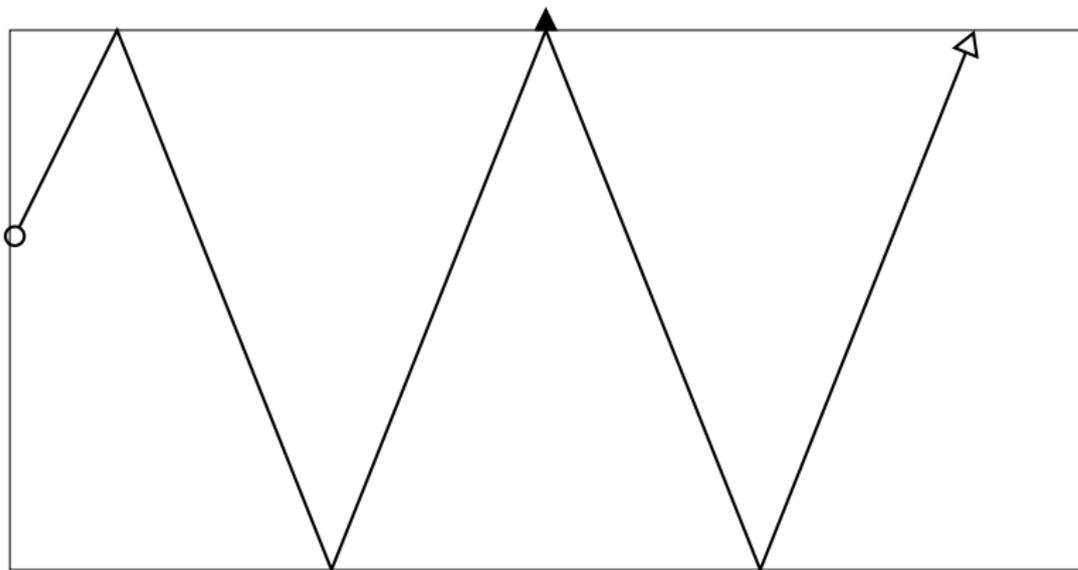

- 1 Long aperture
- 2 Reflection is retrieved by cross-correlation
- 3 Limited aperture
- 4 Reflection is not retrieved

## Ray diagram

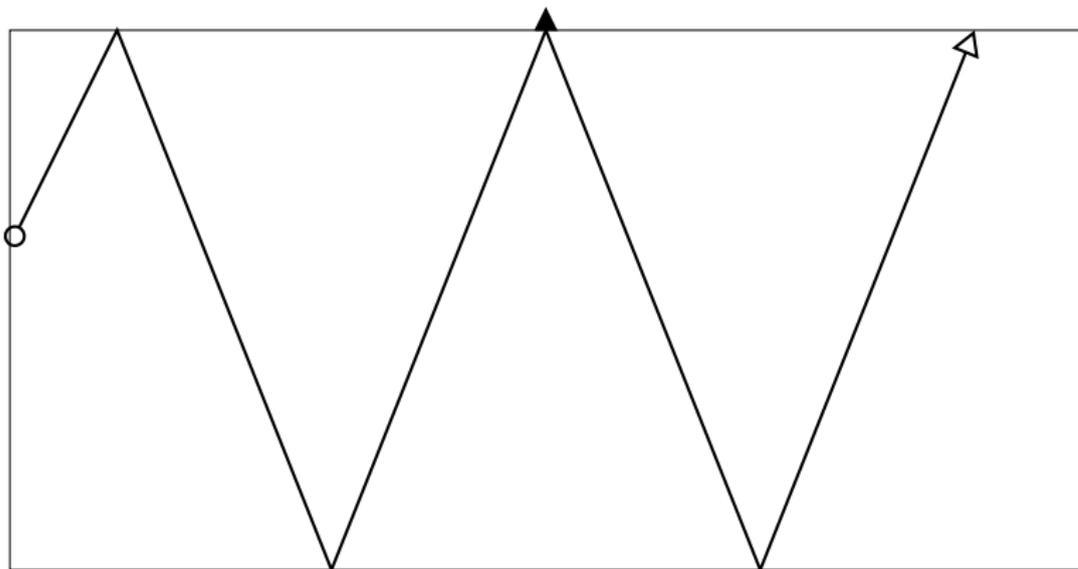

- ① Long aperture
- ② Reflection is retrieved by cross-correlation
- ③ Limited aperture
- ④ Reflection is not retrieved

## Ray diagram

- 3 Limited aperture**
- 4 Reflection is not retrieved

## Moho model with 5 scatterers

- 5 scatterers: diameter of 4 km and contrast =  $-15\%$
- 100 km long array with 0.4 km spacing
- 20 crustal sources far offset from middle
- Ricker wavelet with bandwidth 0.5-3 Hz

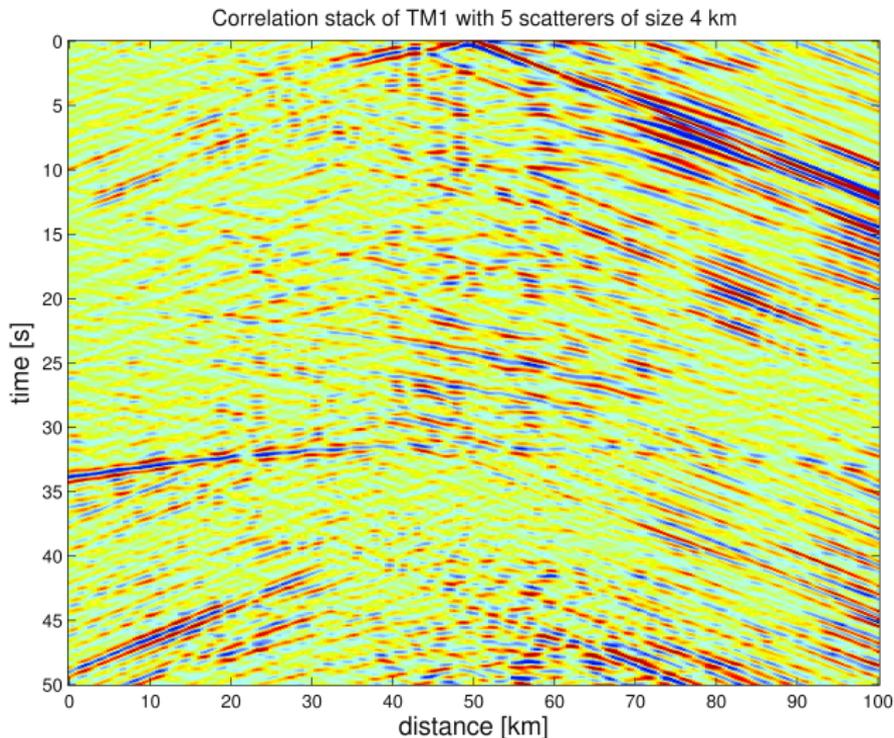

# Moho model with 5 scatterers

- Active source at the center

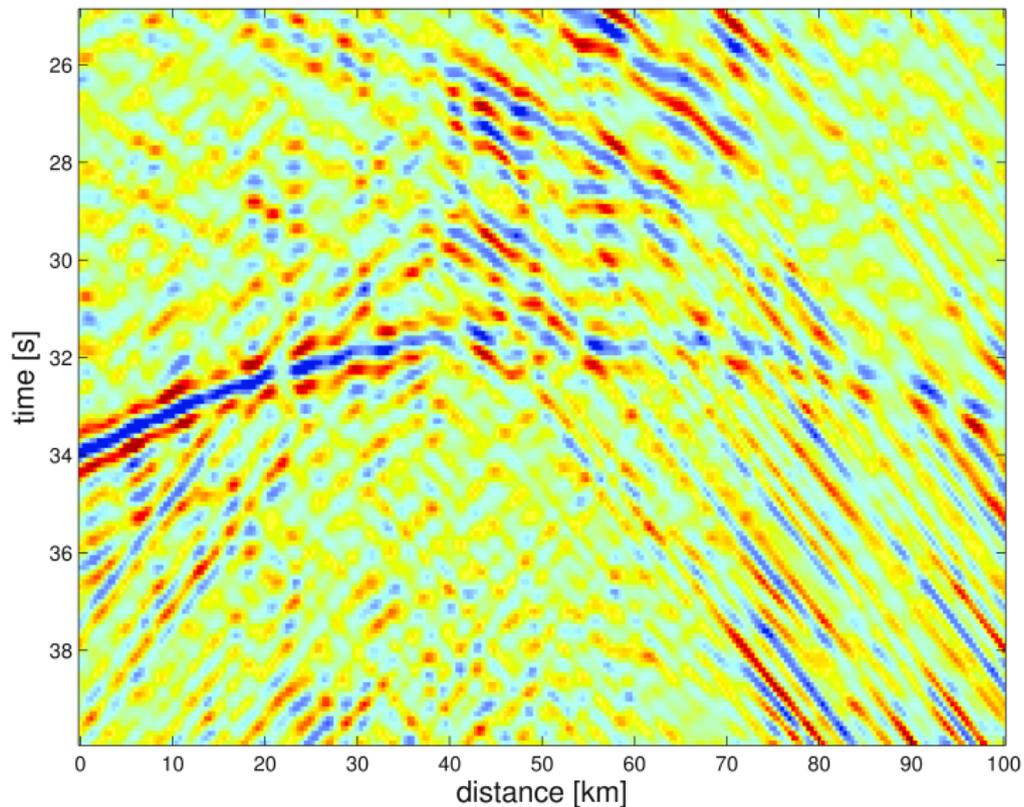

## Moho model with 5 scatterers

- Cross-correlogram with virtual source at the center

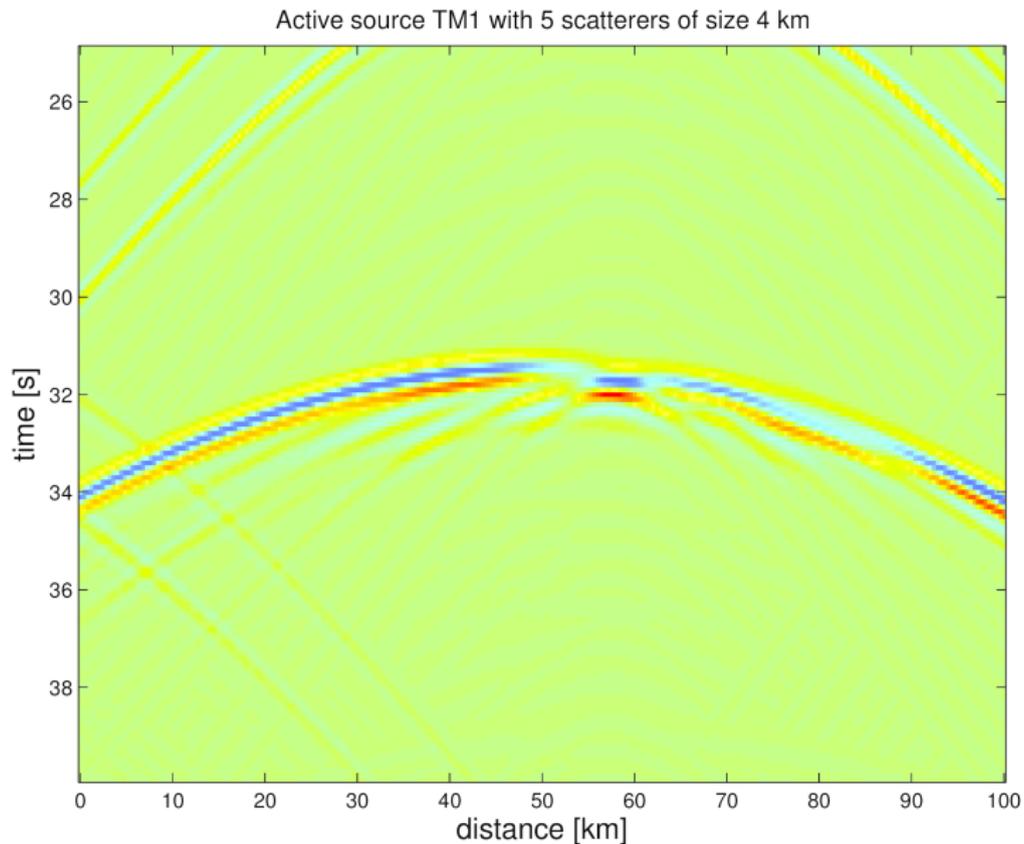

# Moho model with 5 scatterers

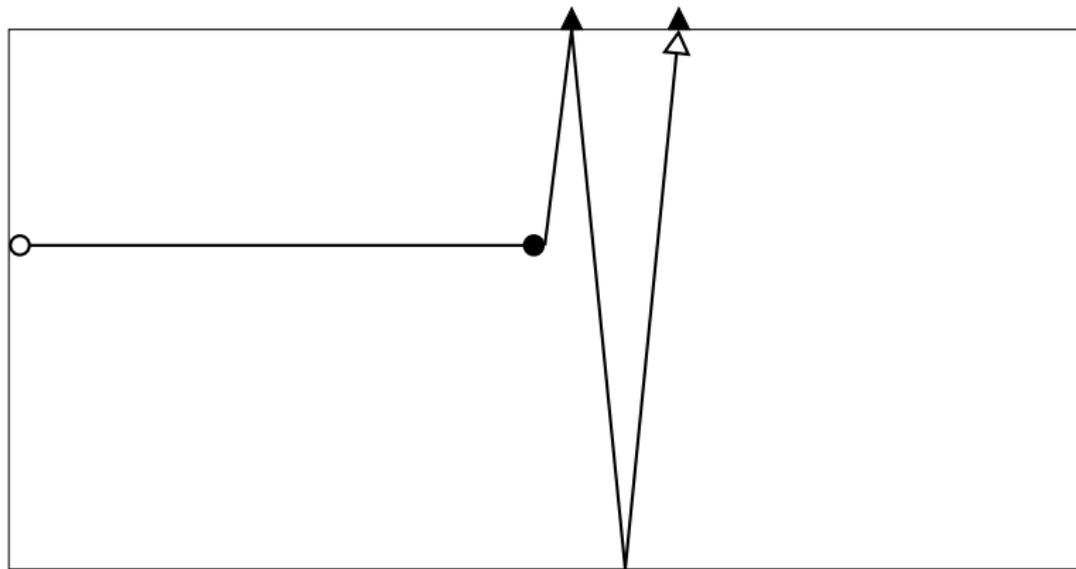

Correlation stack of TM1 with 5 scatterers of size 4 km

# Moho model with 5 scatterers

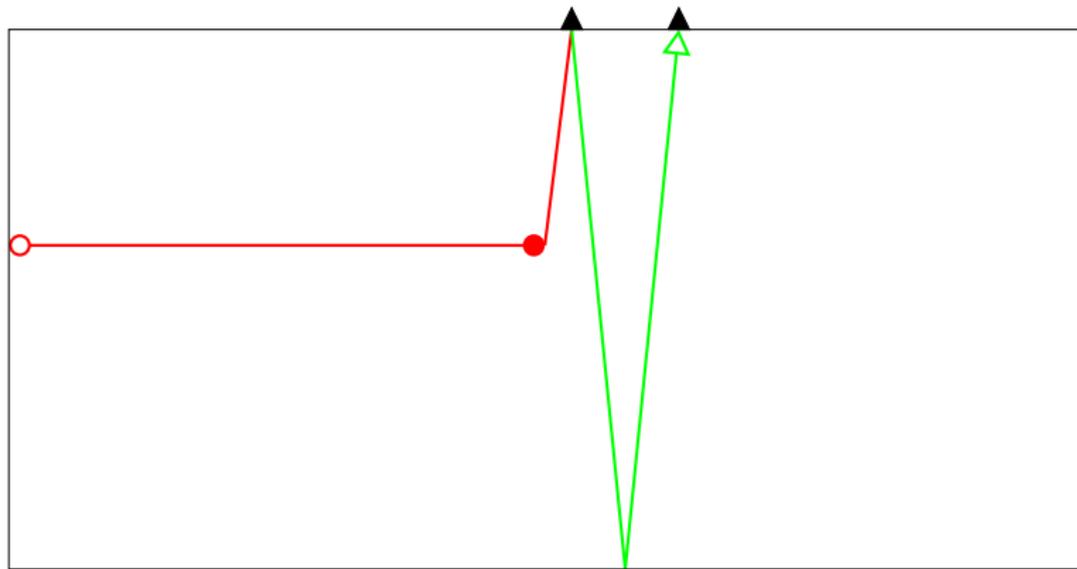

## Ray diagram

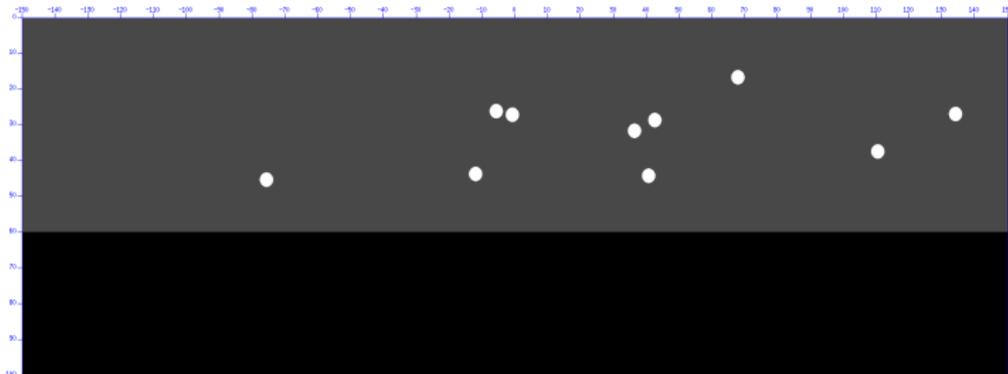

- 1 Scatterers generate strong low wavenumber reflections

## Ray diagram

- 1 Cross-correlation yields the correct reflection retrieval in green

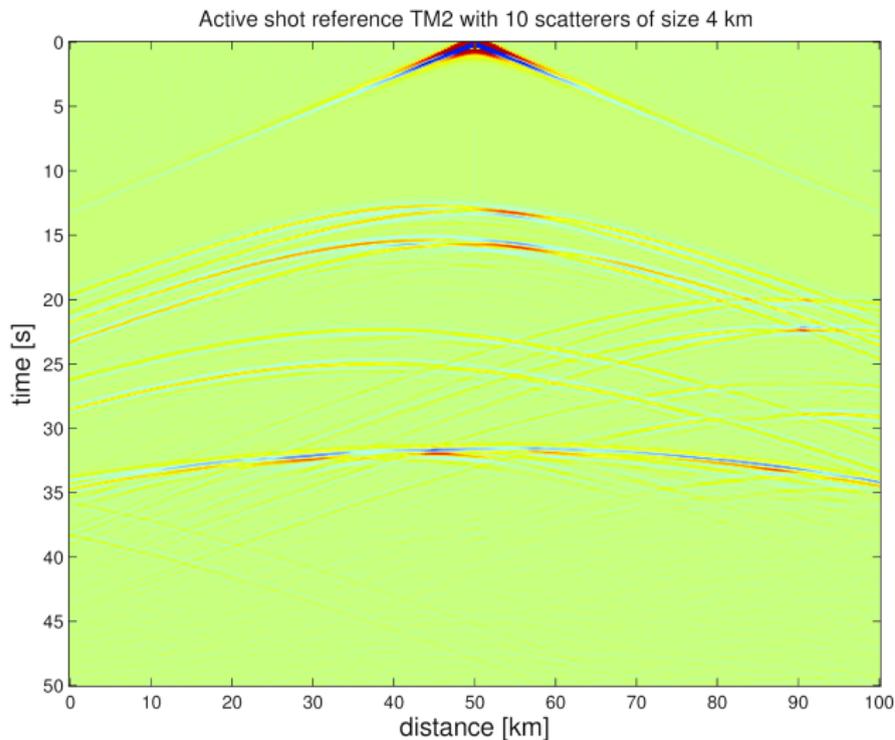

## Moho model with 10 scatterers

- 10 scatterers: diameter of 4 km and  $-15\%$  contrast
- 100 km long array with 0.4 km spacing
- 20 crustal sources far offset from middle
- Ricker wavelet with bandwidth 0.5-3 Hz

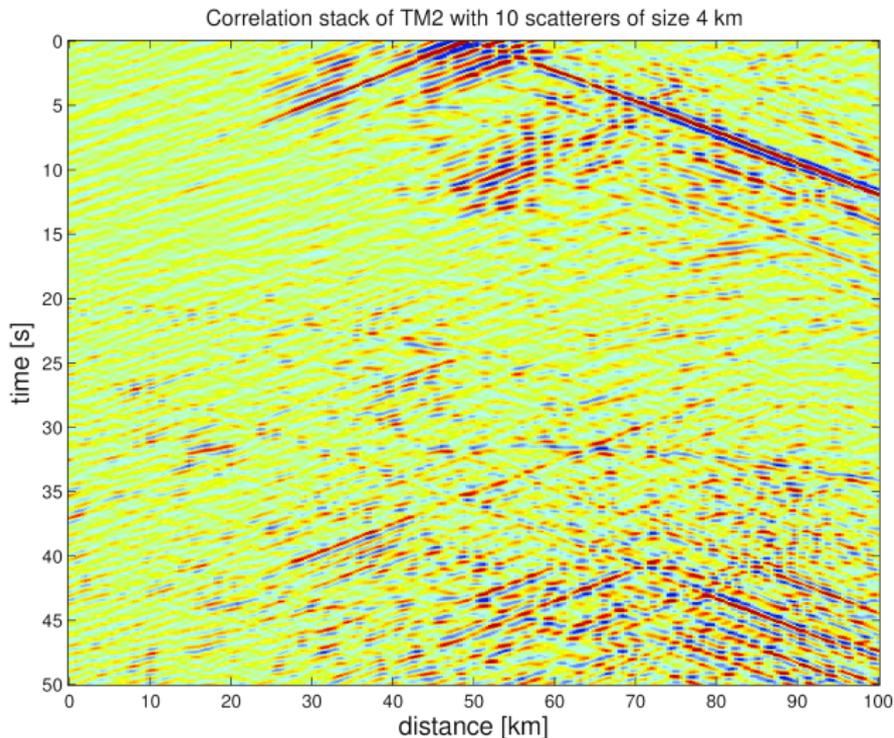

# Moho model with 10 scatterers

- Active source at the center

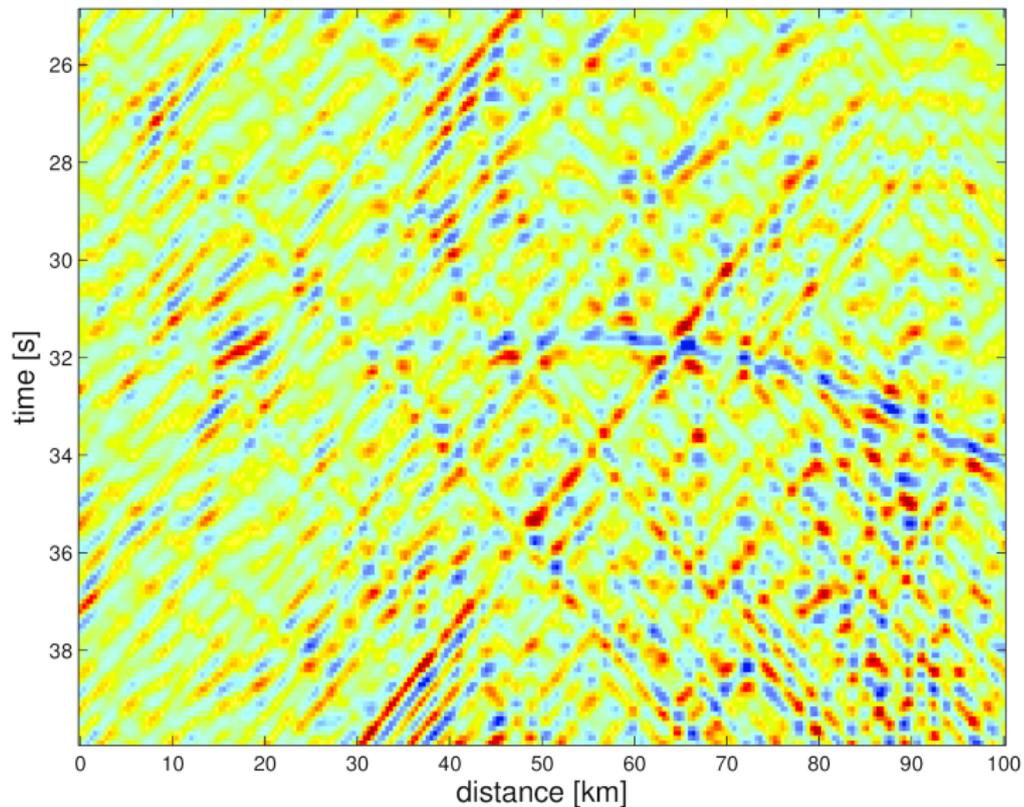

# Moho model with 10 scatterers

- Cross-correlogram with virtual source at the center

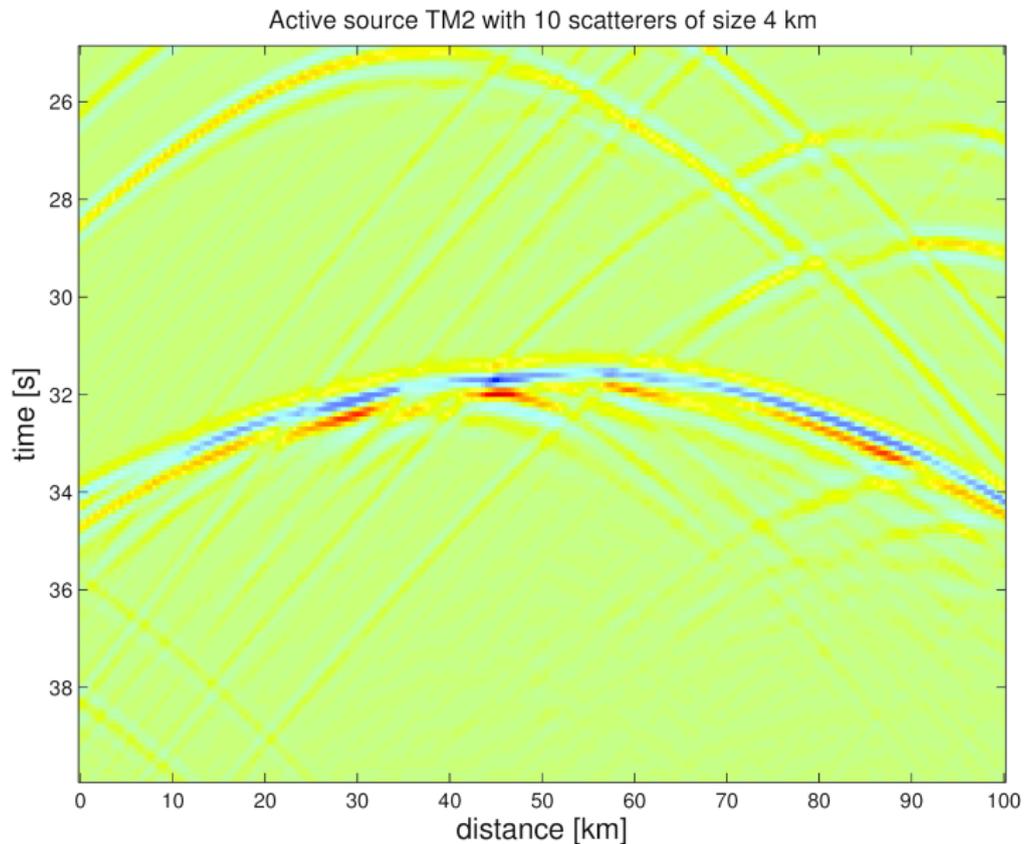

# Moho model with 10 scatterers

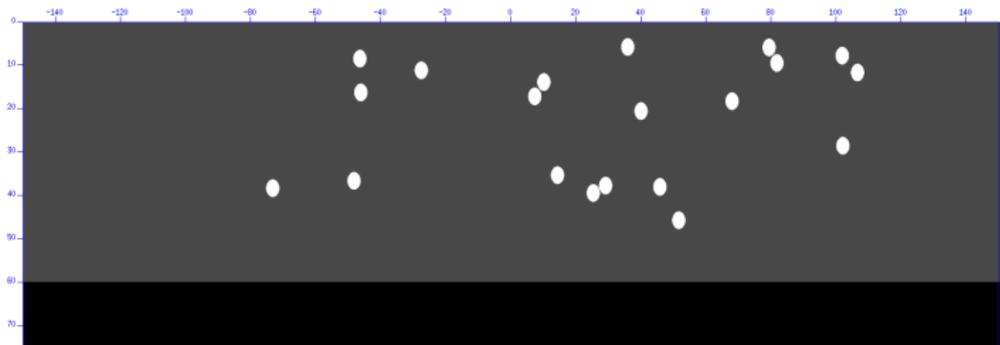

Correlation stack of TM2 with 10 scatterers of size 4 km

# Moho model with 10 scatterers

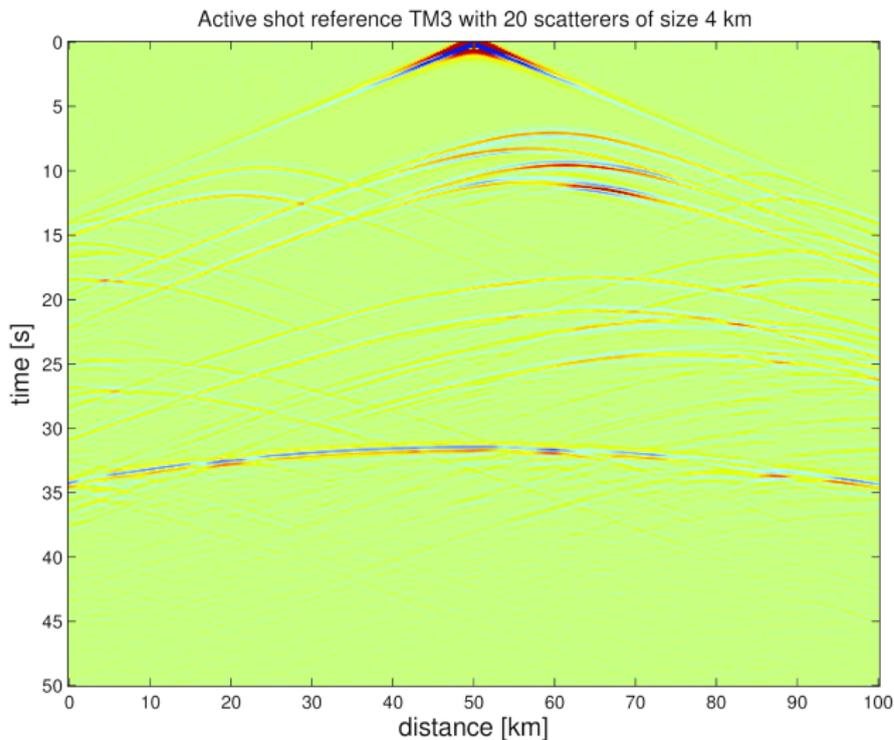

## Moho model with 20 scatterers

- 20 scatterers: diameter of 4 km and  $-15\%$  contrast
- 100 km long array with 0.4 km spacing
- 20 crustal sources far offset from middle
- Ricker wavelet with bandwidth 0.5-3 Hz

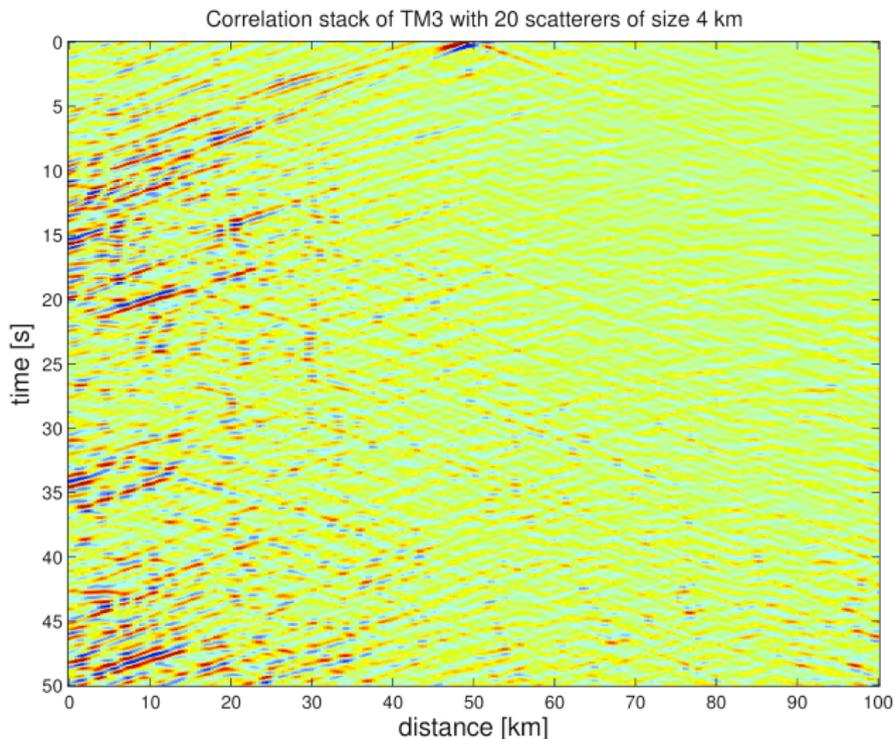

# Moho model with 20 scatterers

- Active source at the center

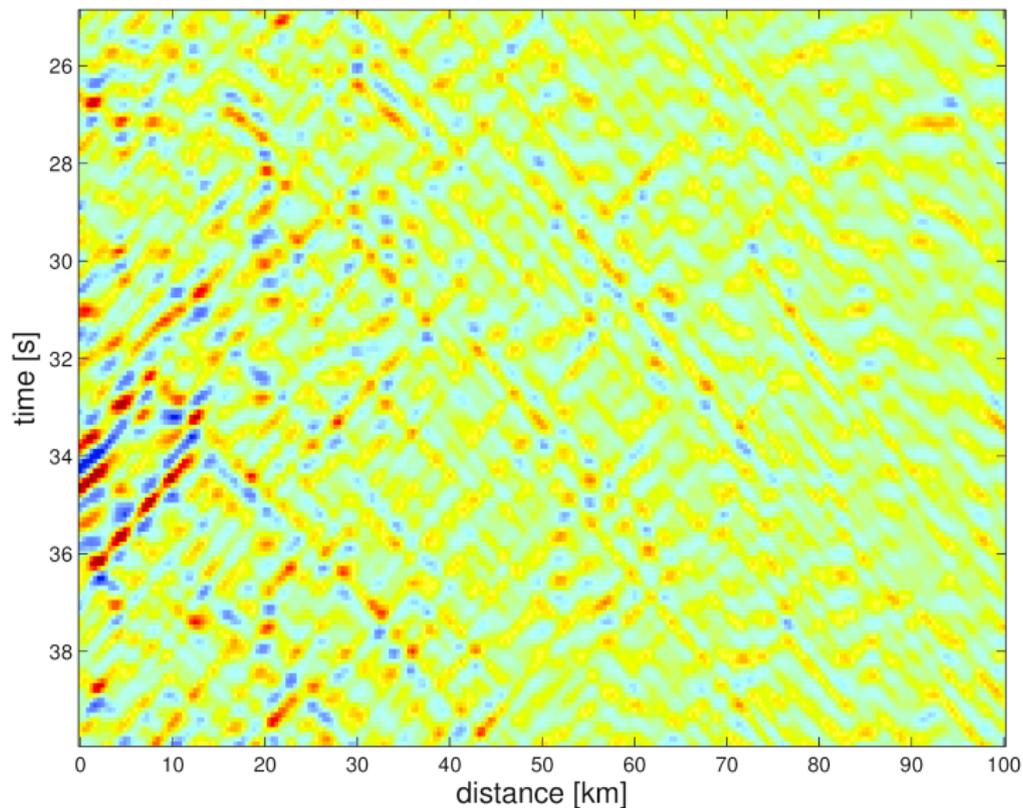

## Moho model with 20 scatterers

- Cross-correlogram with virtual source at the center

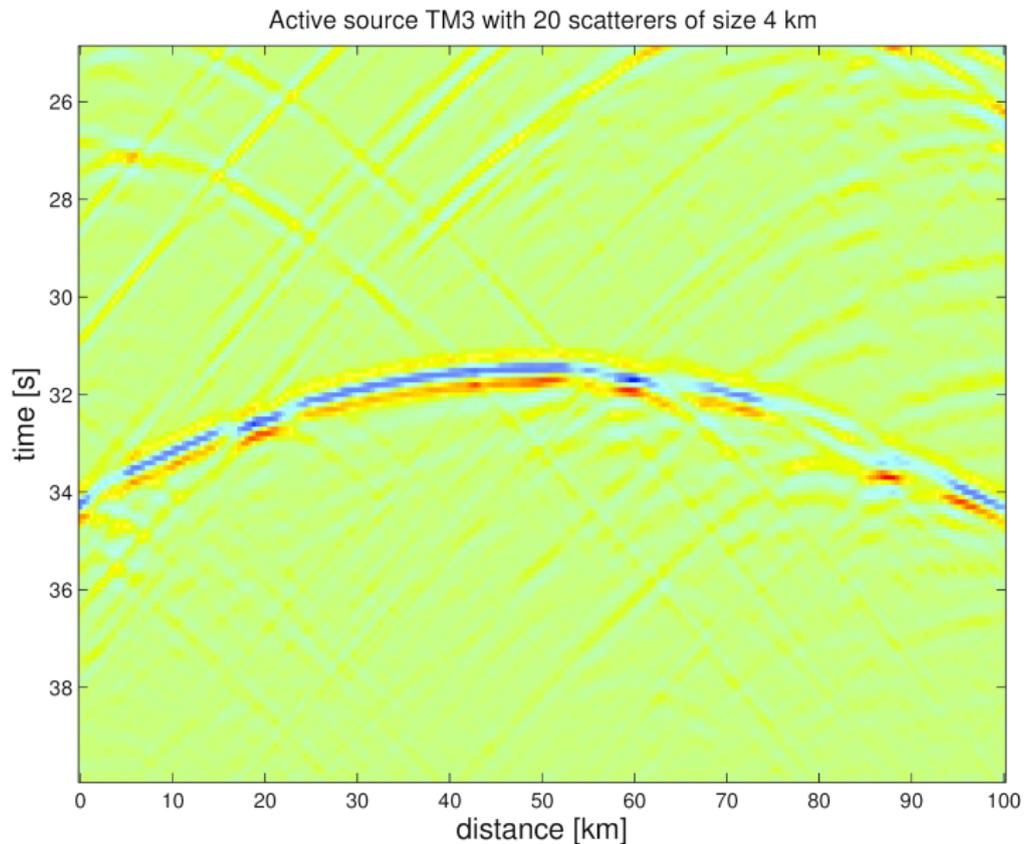

# Moho model with 20 scatterers

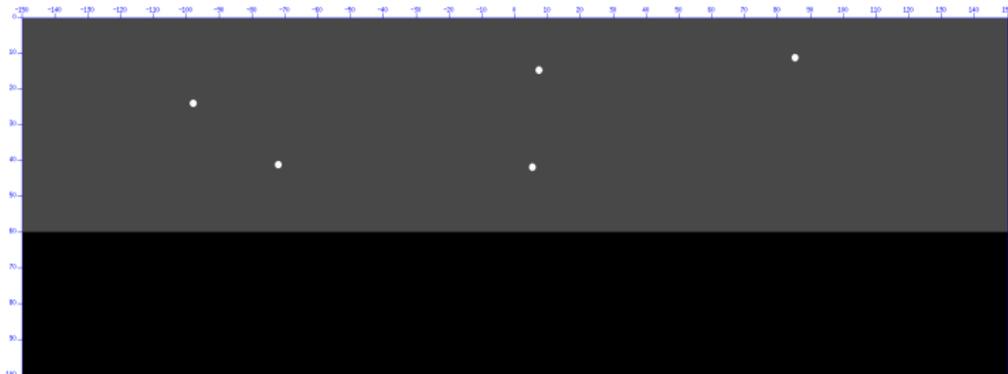

Correlation stack of TM3 with 20 scatterers of size 4 km

# Moho model with 20 scatterers

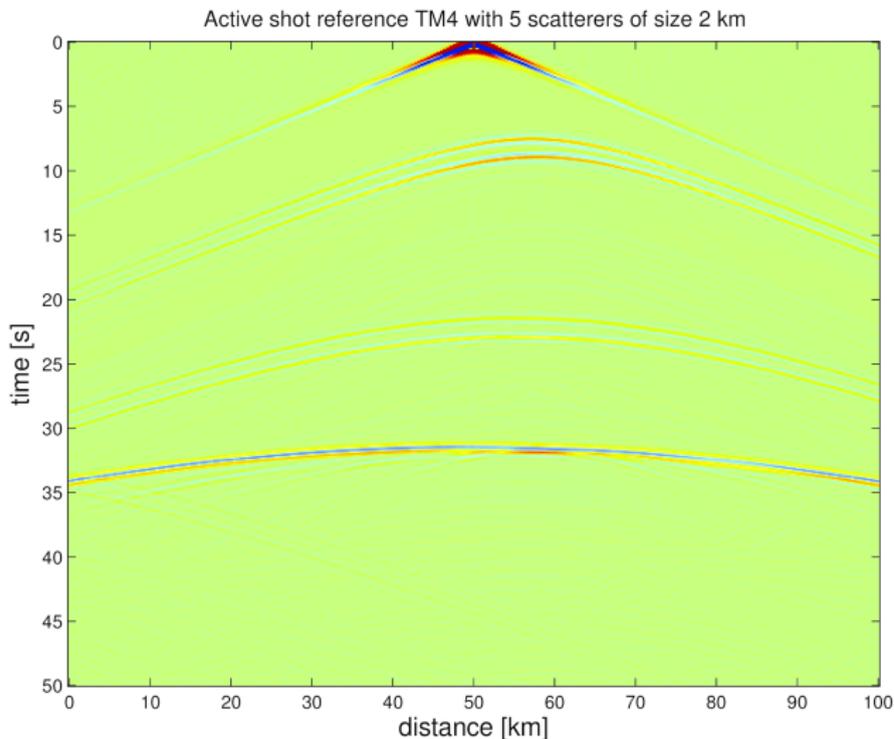

## Moho model with 5 smaller scatterers

- 5 scatterers: diameter of 2 km and  $-15\%$  contrast
- 100 km long array with 0.4 km spacing
- 20 crustal sources far offset from middle
- Ricker wavelet with bandwidth 0.5-3 Hz

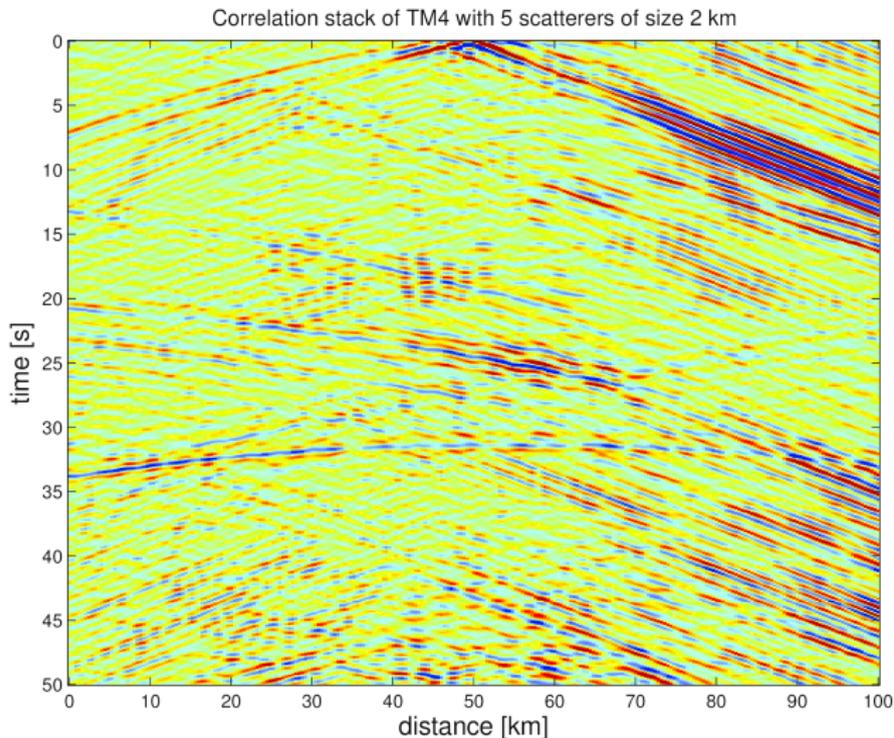

# Moho model with 5 smaller scatterers

- Active source at the center

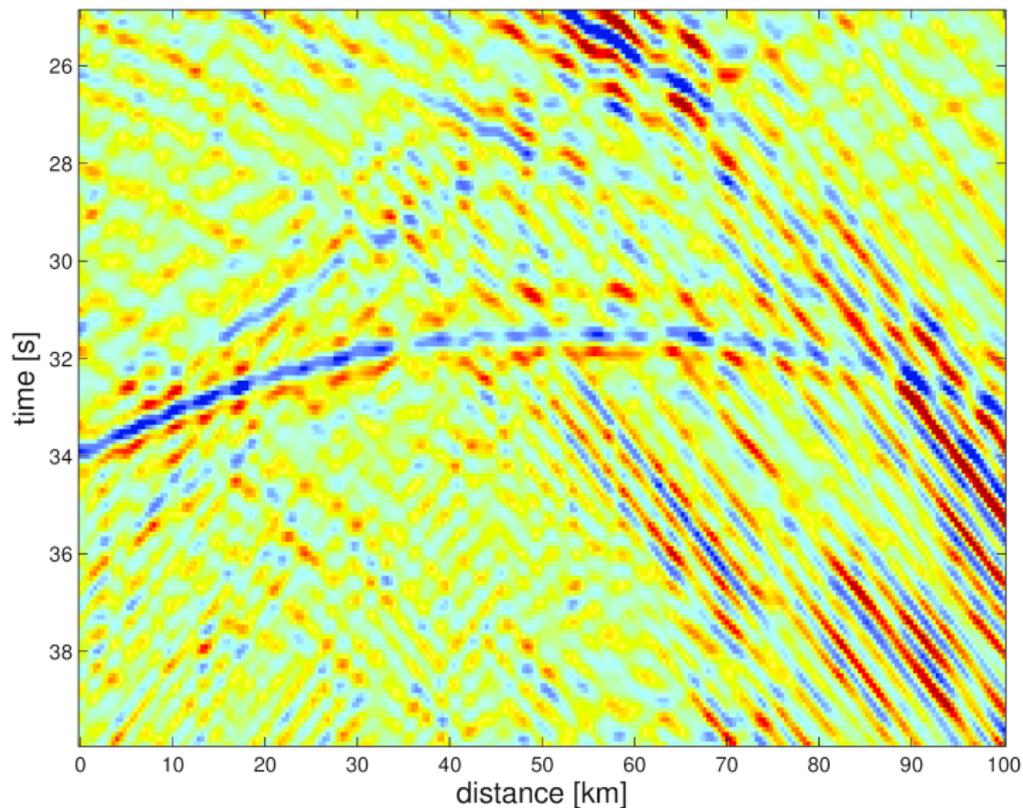

## Moho model with 5 smaller scatterers

- Cross-correlogram with virtual source at the center

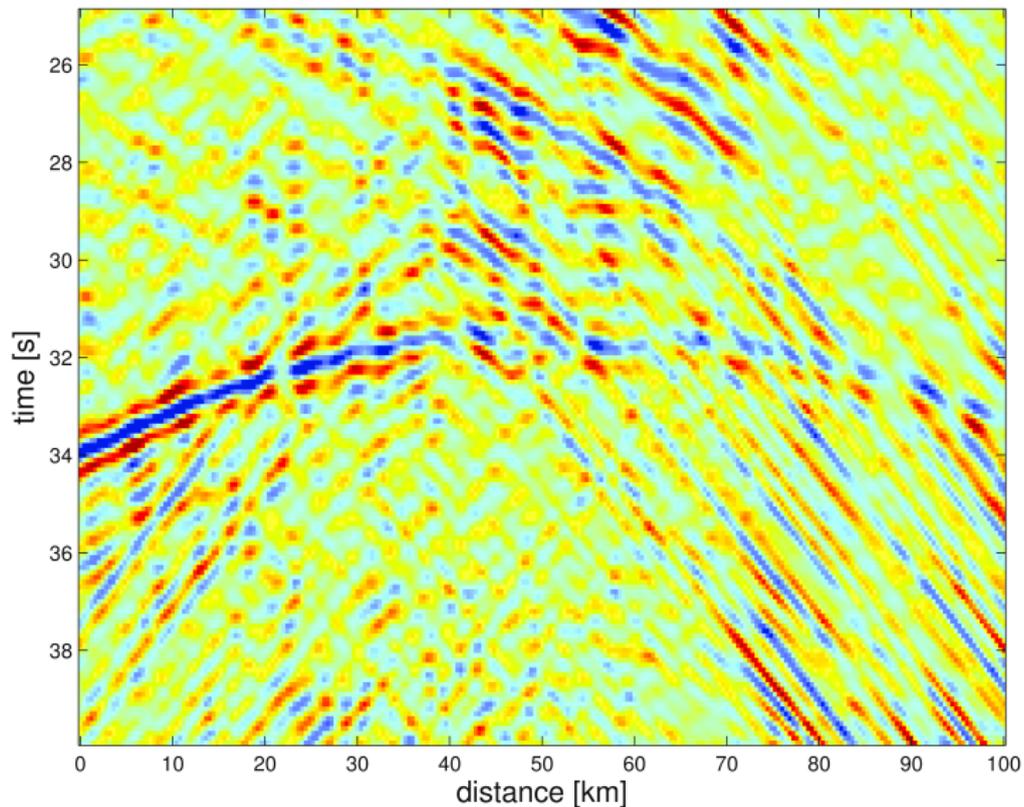

# Moho model with 5 smaller scatterers

Correlation stack of TM4 with 5 scatterers of size 2 km

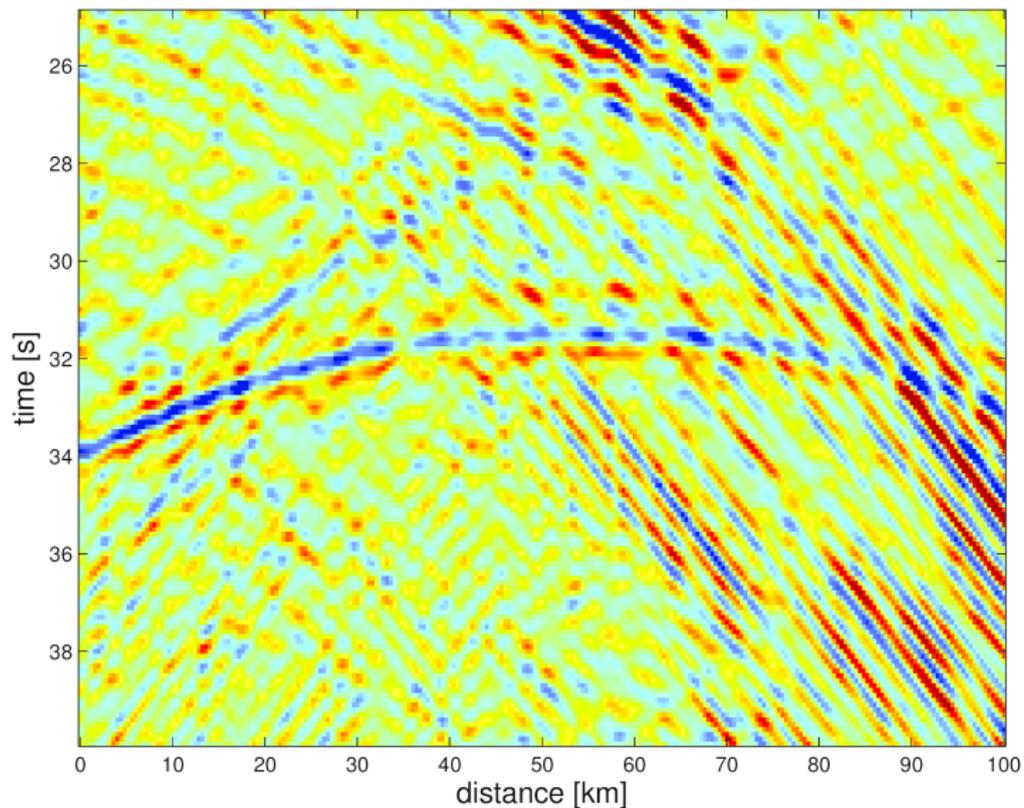

# Moho model with 5 scatterers

Correlation stack of TM1 with 5 scatterers of size 4 km

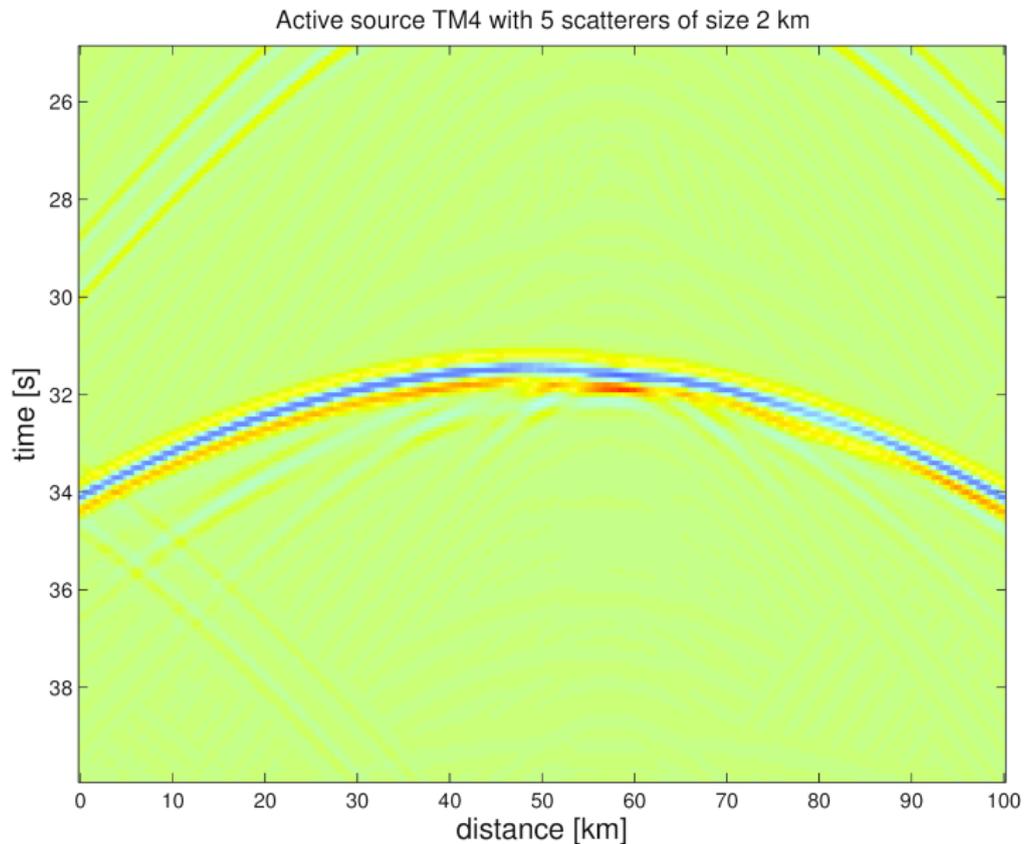

# Moho model with 5 smaller scatterers

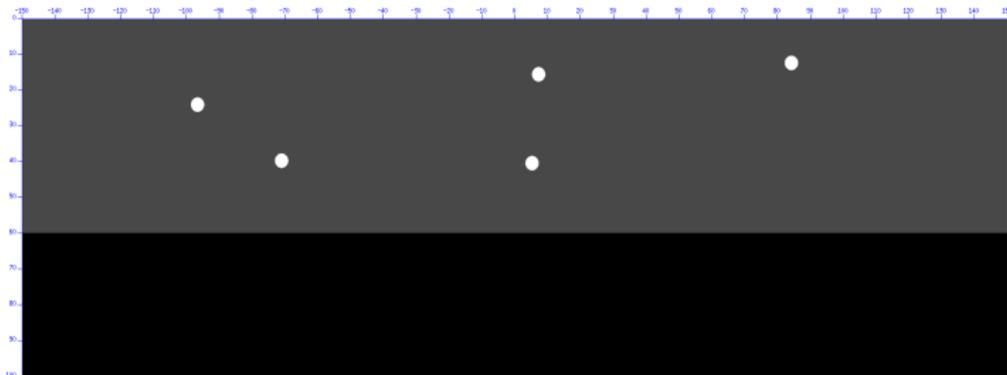

Correlation stack of TM4 with 5 scatterers of size 2 km

# Moho model with 5 smaller scatterers

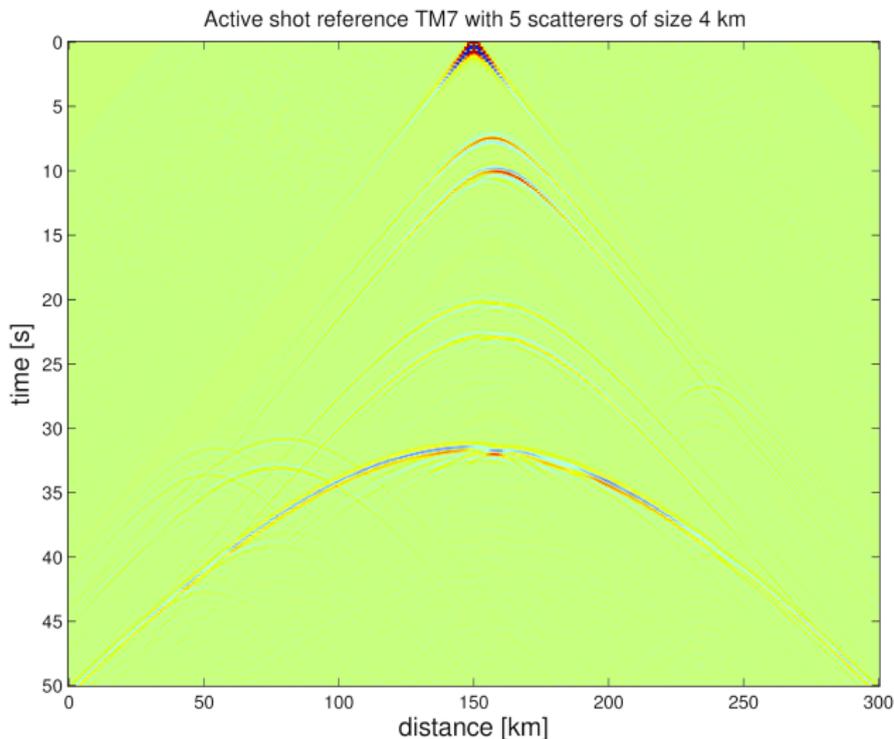

## Moho model with 5 scatterers and 300 km array

- 5 scatterers: diameter of 4 km and  $-15\%$  contrast
- 300 km long array with 1 km spacing
- 20 crustal sources far offset from middle
- Ricker wavelet with bandwidth 0.5-3 Hz

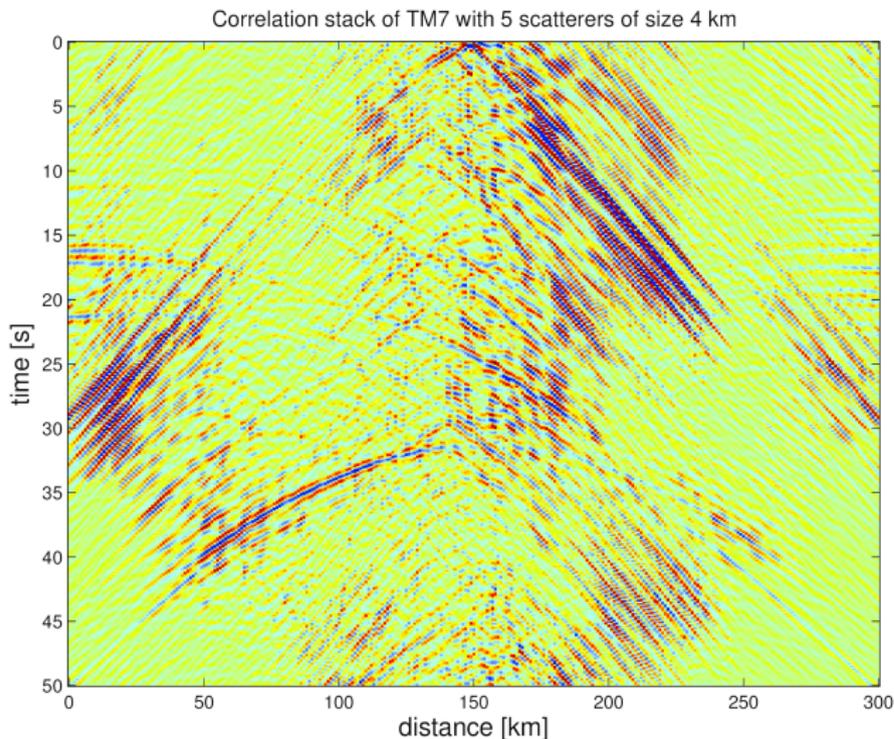

# Moho model with 5 scatterers and 300 km array

- Active source at the center

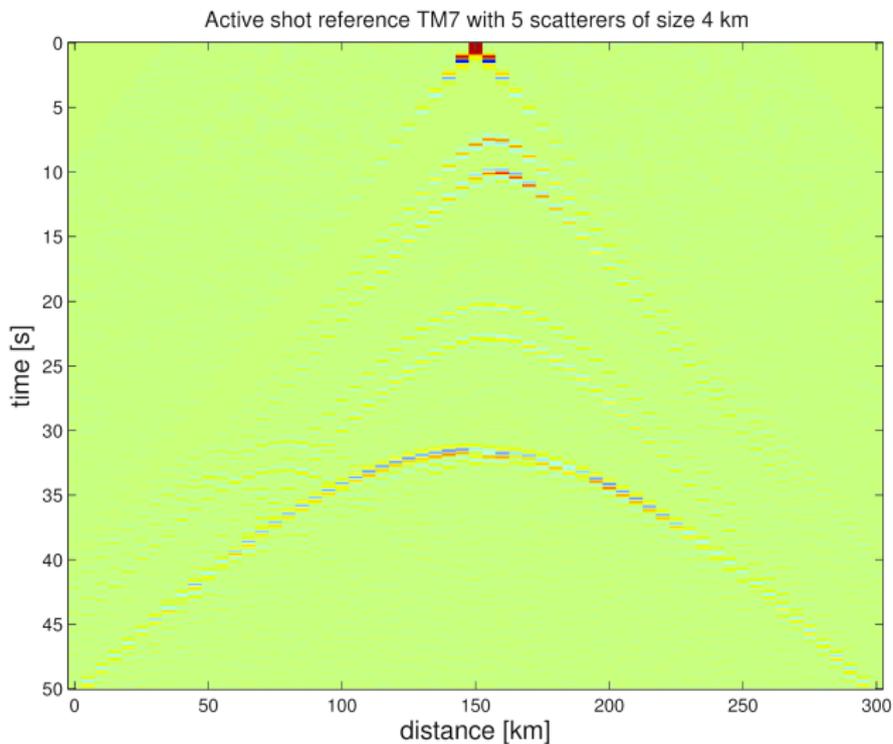

# Moho model with 5 scatterers and 300 km array

- Cross-correlogram with virtual source at the center

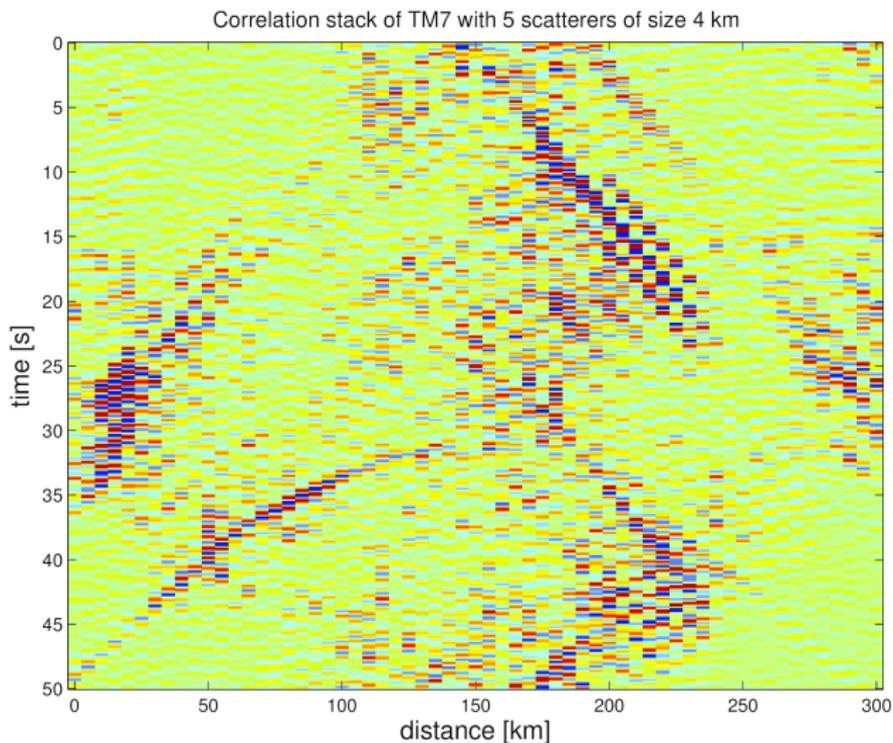

# Hi-CLIMB equivalent array

- Active source at the center

# Hi-CLIMB equivalent array

- Cross-correlogram with virtual source at the center

- 4 Results
  - Moho beneath Tibetan Plate
- 5 Conclusion**
- 6 Outlook

# Conclusions

- ① Scatterers generate low wavenumbers and thus increase illumination of the image target
- ② Scatterers can introduce additional artifacts
- ③ Size and location of scatterers influences the retrieval of the reflection
- ④ Too high density of effective scatterers adversely affects the retrieval

## Outlook to reality

- Heterogeneity in the crust prevails over a wide range of scales and is region dependent
- The optimal effective heterogeneity of the crust can be set by applying a bandpass filter to the recorded wavefield
