

Infrared Imaging of Feldspars in Intrusive Rocks

Phil Harris, Neil Pendock – Geospectral Imaging Ltd

Rainer Bars, Harri Karjalainen – Spectral Imaging Ltd

Jack Voncken, Mike Buxton – TU – Delft

Infrared Wavelength Ranges

Fe Oxides
Transition Metals

Hydroxyls
(Clays, Phyllosilicates)
Water
Carbonate
Hydrated sulphates
OH-bearing Minerals (Amphiboles)

Silicates
(Olivine, Pyroxene, Garnet)
(Quartz, Feldspar)
Si-O
Al-O-Si

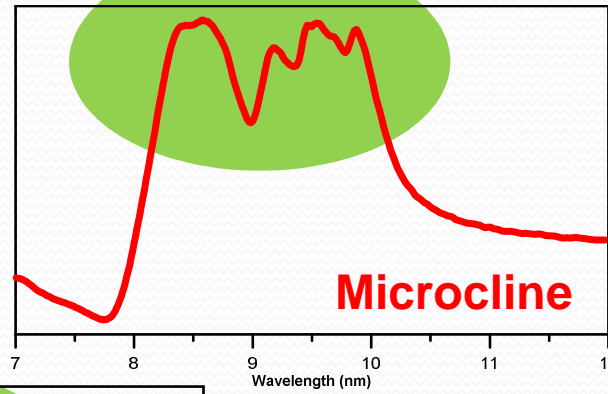

LWIR Imaging Study Objectives

LWIR Imaging of Feldspars:

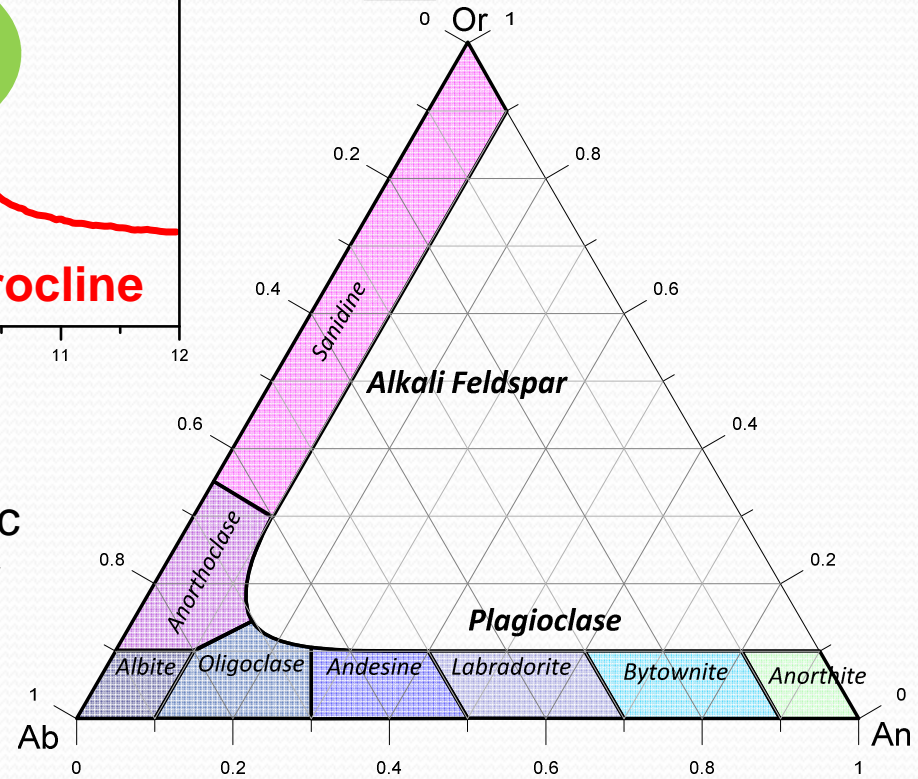

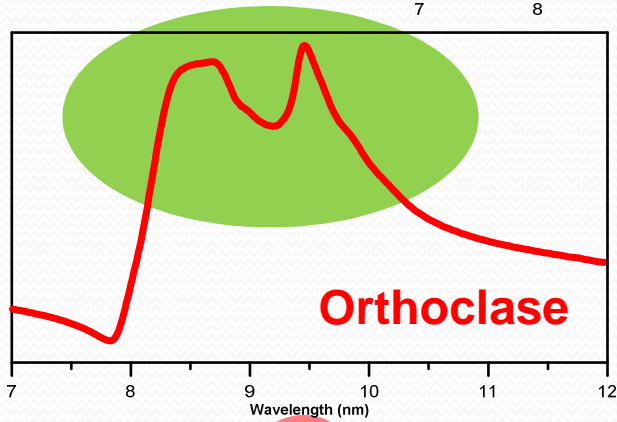

1. How to Correct, Prepare and Process LWIR Image Data?
 1. System correction requirements
 2. Data correction and preparation requirements
 3. Spectral processing requirements
2. What Spectral Signatures can be used to Characterise the Feldspars?
 1. Feldspar identification in the LWIR
 2. Feldspar species discrimination
 3. Methods to monitor changing compositions
3. What are the System Requirements for Imaging Feldspars?
 1. System resolution (spectral and spatial)
 2. Parameters that record systematic changes in feldspars

Feldspar LWIR Library Spectra

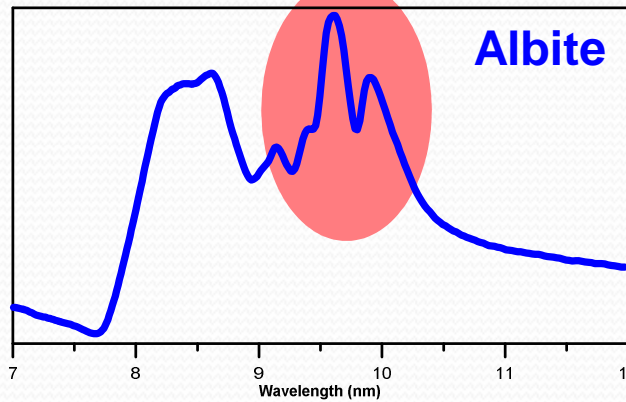

Triclinic Feldspar

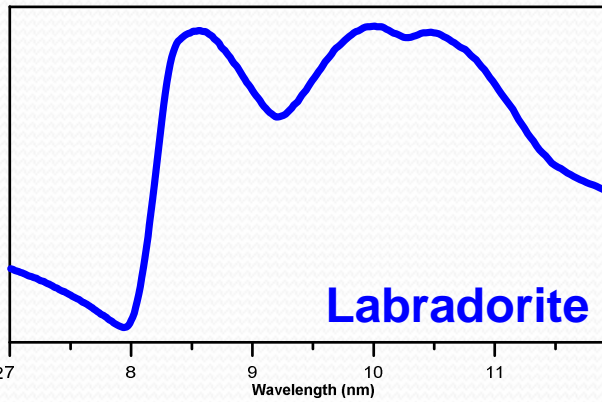

Monoclinic Feldspar

Albite

Labradorite

Anorthite

Spectra from JHU Spectral Library in ENVI

LWIR System Specifications

LWIR Systems	OWL
Wavelength Range	7.4 μ m to 12.4 μ m
Bands (spectral pixels)	84
Spatial Pixels	384
Spectral Resolution	100nm
Detector Type	MCT
Spectral Sampling	48nm
Instrument Temperature	300 K Stabilized

After Holma et al., 2009

Sample Suite Feldspar Compositions

- Ylamma Baltic Brown
- Ristijarvi Grey
- Royal Beige
- Granite Gneiss (India)
- Norway Labradorite (Light)
- Ylamma Labradorite
- Norway Labradorite (Dark)
- Bianco Perla
- Antique Bronze
- Ylamma Baltic Green
- Pegmatite
- Anorthosite
- Albite Diabase
- Ylamma Baltic Brown
- PG Black
- Grey Granite (Finland)
- Balmoral Red

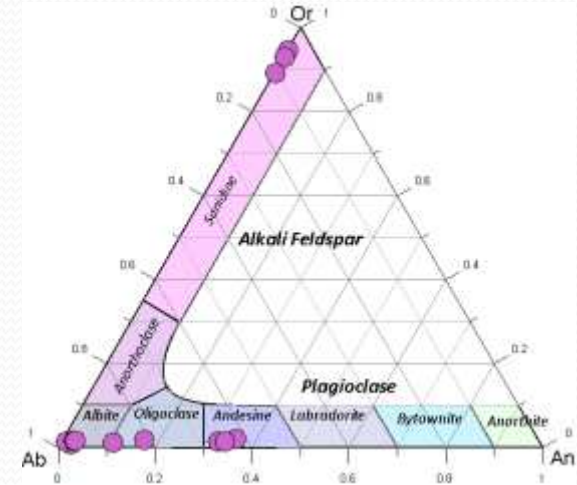

LWIR Image (Balmoral Red)

Mineral Map

- Feldspar (Alkali?)
- Feldspar (Plag?)
- Quartz
- Mafic Minerals
- Mafic Minerals

Infrared Image

Photograph

100mm

Note: SWIR images show sericite alteration in some zones and feldspars

LWIR Image (Balmoral Red)

Mineral Classification Image

- Red square: Feldspar (Alkali?)
- Blue square: Feldspar (Plag?)
- Yellow square: Quartz
- Pink square: Mafic Minerals
- Green square: Mafic Minerals

Feldspar
(K-feldspar?)

Feldspar
(Plagioclase?)

Quartz

100mm

LWIR Image (Balmoral Red)

Wavelength Feature Maximum between 9um and 10um

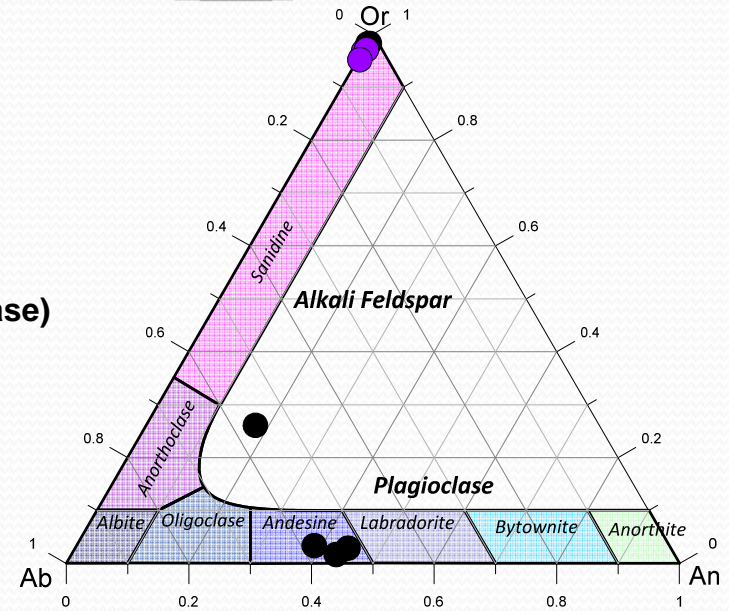

100mm

LWIR Image (Baltic Brown)

Mineral Map

- Red: Feldspar (Alkali)
- Yellow: Feldspar (Alkali)
- Blue: Feldspar (Plagioclase)
- Green: Quartz
- Purple: Mafic Minerals
- Dark Green: Mafic Minerals

Wavelength Maxima

Summary

- Variations of LWIR signatures between feldspars are observed
- Wavelength shifts observed in reflectance bands
- These changes have spatial coherency
- Supported by petrographic investigations

Challenges

- Identification of specific feldspar species currently difficult from datasets at this stage
- Compositional discrimination yet to be tested
- Albite LWIR signatures different to those observed from other plagioclase minerals
